109 16 — Next 88

Boss, I'm now expanding the whole thing into a single, complete STARVNT Customer E2E Product Blueprint — not just the UI, but Customer Experience + Event State + Commercial Flow + Payment Protection + Vendor Execution + Event Circle + Live Event + Completion + Settlement + Refund/Recovery + Event Memory together. **The biggest change will be:**

> **STARVNT will not only book events. STARVNT will create a controlled trust lifecycle between the customer's money, the booking, vendor execution, and the outcome.**

And the core principle for payment:

> **Customer payment is verified first. Vendor settlement is earned through successful service delivery and verification.**

---

1 🚀 STARVNT CUSTOMER APP

```
COMPLETE E2E PRODUCT BLUEPRINT
```

Product Promise

> **You tell us what you're planning. We'll figure out the rest.**

Customer complexity:

```
LOW
```

STARVNT internal complexity:

```
HIGH
```

Core truth:

```
AUTHORITATIVE
```

Aura+ intelligence:

```
HELPFUL
```

---

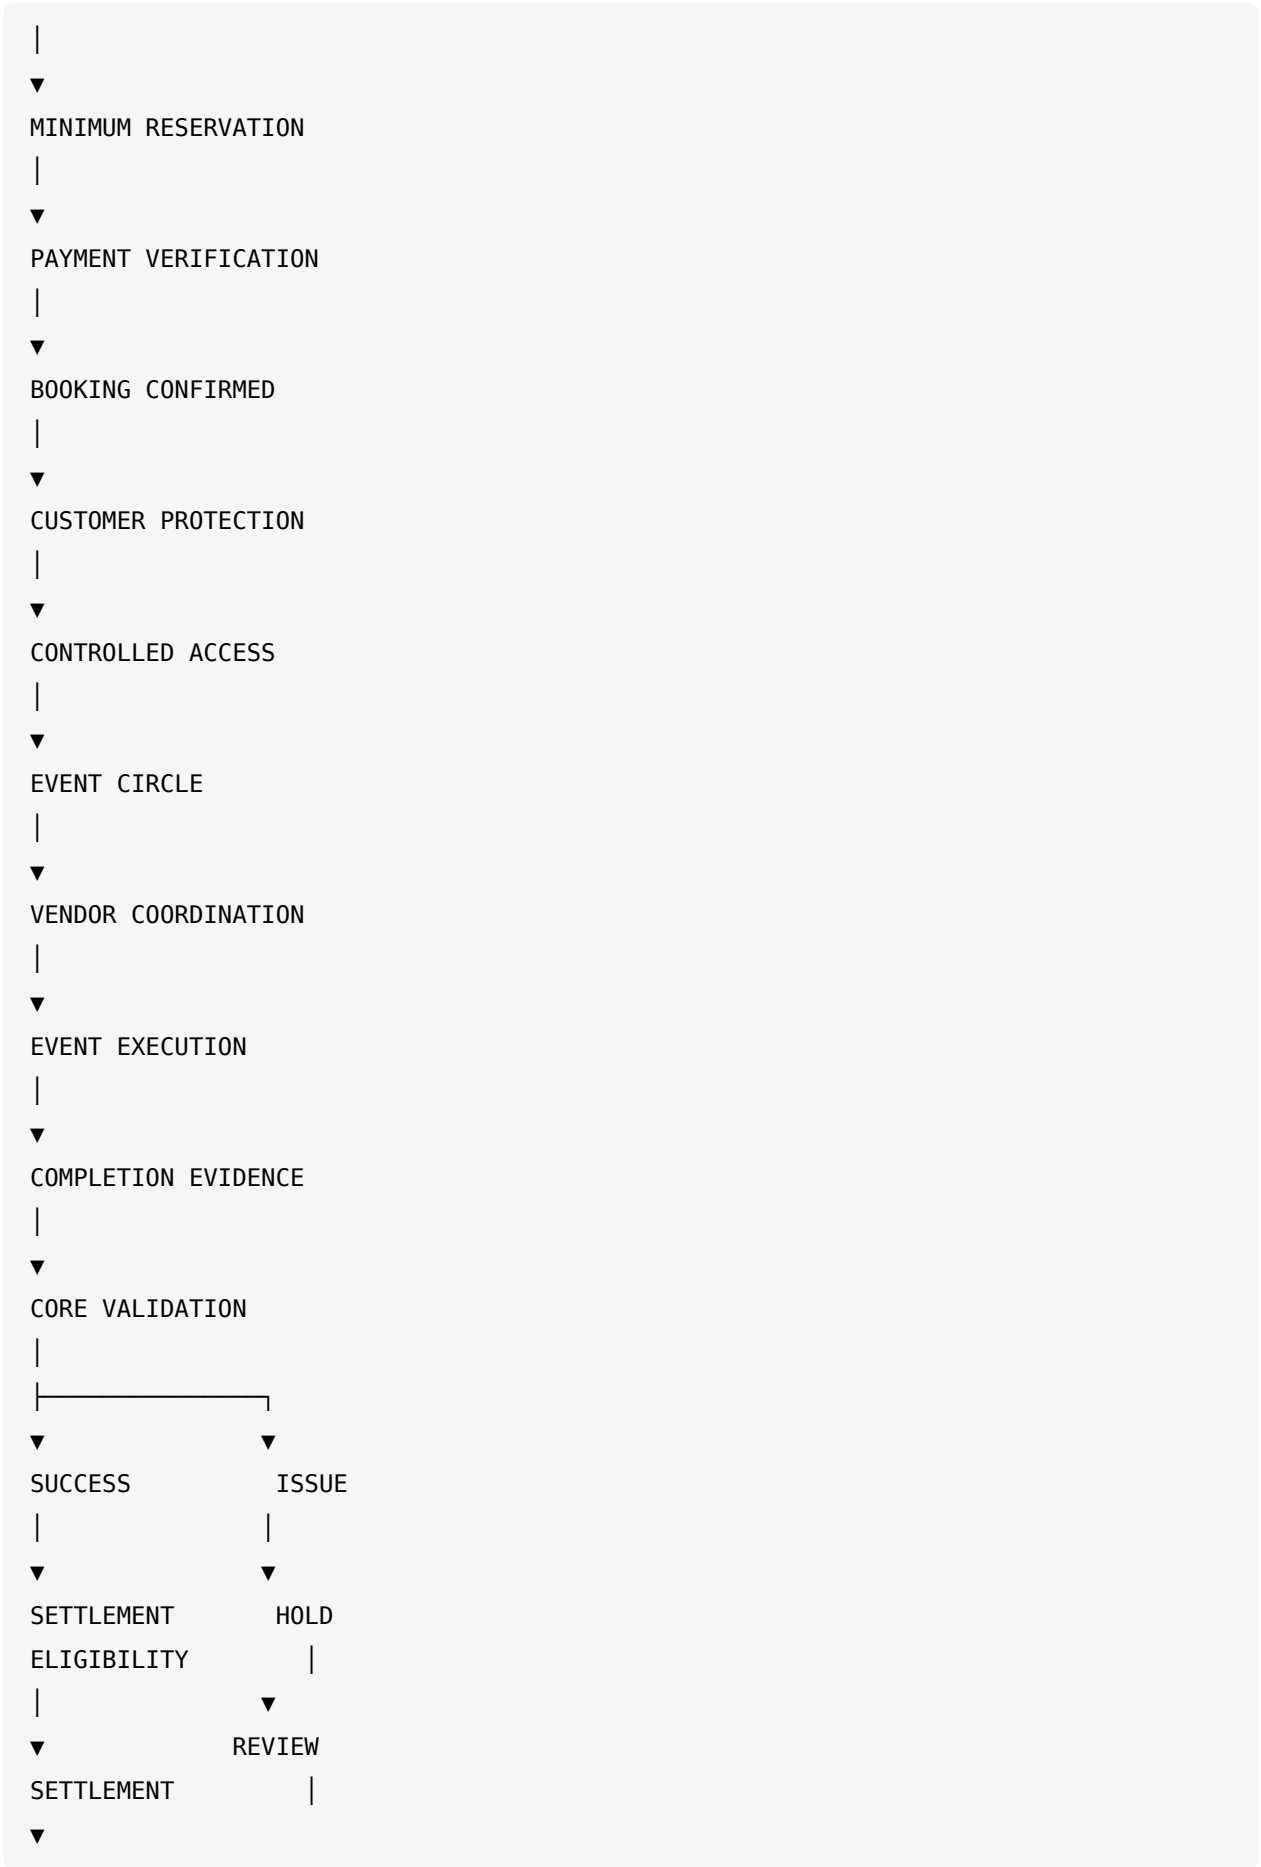

2 00 — THE COMPLETE STARVNT MODEL

If you look at the whole system together:

```

---

3 01 — 🌟 STARVNT ENTRY

Customer opened the app for the first time. **Traditional app:**

> **Login → Dashboard → Create Event**

STARVNT:

> **Life's special moments, made simple.**

Primary CTA: What are you planning? **or:** Get Started Followed immediately by a conversational experience.

---

4 02 — 🗣️ CUSTOMER INPUT

Customer can start in three ways: Voice 🎤

> **"My daughter's wedding is on 26 November, 500 people, in New Town."**

Text ⌨️

> **"My daughter's wedding is on 26 November..."**

Media 📎 Customer can provide a venue photo, inspiration image, previous event image, decoration reference, etc.

---

5 03 — 🧠 AURA+ INTENT UNDERSTANDING

Customer said:

> **“My daughter’s wedding is on 26 November in New Town for around 500 guests. My budget is ₹3 lakh.”**

Aura+ will internally create: EVENT_TYPE = WEDDING DATE = 26 NOVEMBER DESTINATION = NEW TOWN GUEST_COUNT = 500 BUDGET = ₹3,00,000 But it will not show the customer technical JSON or database structure. **Customer will see:**

> **Got it. Here’s what I understood.**

---

6 04 — 🧩 CONTEXT CLASSIFICATION

Aura+ will bucket the context into several categories. **Known** What the customer said. **Confirmed** What the customer has explicitly approved. **Inferred** What the system has reasonably understood. **Missing** What needs to be known. **Ambiguous** What is not clear. **Recommended** What might be useful for the event. **Already Arranged** What the customer has already arranged themselves. This distinction is very important.

---

7 05 — ❓ SMART CLARIFICATION

STARVNT will not interrogate the customer. Suppose the venue is unknown. **Aura+:**

> **“Do you already have a venue?”**

Customer:

> **“Yes, Kisan Palace.”**

System:

```
VENUE
```

8 CUSTOMER_PROVIDED

9 CONFIRMED

Then the next necessary question. **This way:**

> **Conversation becomes the form.**

---

10 06 — 💍 EVENT CREATION

When sufficient context is obtained:

> **Your event is taking shape.** ✨

Customer: My Daughter's Wedding 26 November New Town, Kolkata 500 Guests ₹3,00,000 Target Budget
CTA: Build My Event Plan Here the Event will be created.

---

11 07 — EVENT CONTEXT

Once the Event is created, the customer's future actions will all be within the Event's context.

```
CUSTOMER
↓
EVENT
↓
EVENT TYPE
↓
DATE
↓
DESTINATION
↓
VENUE
↓
GUESTS
↓
BUDGET
↓
REQUIREMENTS
↓
DECISIONS
```

↓

```
BOOKINGS
```

↓

```
EXECUTION
```

---

12 08 — 🧩 EVENT PLAN

STARVNT will now create potential requirements for the event. **Essential** 🔴 Must Have Venue Catering Photography Decoration Makeup Sound Ceremony / Purohit **Recommended** 🟡 Consider Transport Accommodation Hospitality Invitation Anchor Entertainment Backup planning **Optional** ⚪ Enhance Photo Booth Special Effects Live Streaming Premium Entertainment **The language shown to the customer will be:**

We found 14 things that may be needed for your event.

Not:

“You must buy 14 services.”

---

13 09 — ⭐ CUSTOMER DECISION MODEL

STARVNT:

Recommends

Customer:

Decides

Core:

Records the decision

This is the product’s fundamental rule。

---

14 10 — REQUIREMENT RESOLUTION

Customer:

“Let’s arrange photography.”

Customer experience:

Photography

Full Wedding Coverage

Recommended

Find Options

A structured Requirement will be created in the backend。 Requirement

```
├── Event
├── Service Category
├── Service
├── Date
├── Duration
├── Quantity
├── Service Location
├── Coverage
├── Constraints
└── Budget Context
```

The customer will not operate these。

---

15 11 — 📍 SERVICE LOCATION

STARVNT's geographic intelligence will work here。 **One event:**

```
WEDDING
|
├── Photography
|       └── Kisan Palace
|
├── Makeup
|       └── Bridal Room
|
├── Catering
|       └── Banquet Hall
|
├── Decoration
|       └── Stage + Lawn
|
└── Transport
└── Airport → Venue
```

So:

Event Location ≠ Service Location

This is the foundation of vendor matching。

---

16 12 — 🔎 VENDOR DISCOVERY

Customer:

Find Photography Options

STARVNT internally:

```
REQUIREMENT
```

↓

```
SERVICE LOCATION
```

↓

```
VENDOR SERVICE
```

↓

```
SERVICE COVERAGE
```

↓

```
AVAILABILITY
```

↓

```
CAPACITY
```

↓

```
ELIGIBILITY
```

↓

```
TRAVEL
```

↓

```
LOGISTICS
```

↓

```
TOTAL COST
```

↓

```
SUITABILITY
```

↓

```
RANKING
```

Customer will see:

> **We found 3 suitable options for you.**

---

17 13 — 💰 TOTAL COST

Vendor A: ₹44,000 base ₹3,000 travel ₹2,000 additional Total = ₹49,000 **Vendor B:** ₹48,000 base Travel included Additional included Total = ₹48,000 STARVNT will not just compare displayed prices。**Objective:**

> **Lowest Validated Total Cost among vendors that genuinely satisfy the requirement.**

---

18 14 — 🏆 RECOMMENDED OPTION

Customer: Premium Moments Photography ⭐ 4.8 ₹48,000 √ 2 Photographers √ Full-day coverage √ Cinematic film √ Travel included √ 500+ edited photos **Badge:**

> **Best Validated Option**

CTA: Select **Secondary:** Compare

---

19 15 — 🤖 WHY THIS OPTION?

Customer:

> **“Why are you recommending this?”**

Aura+:

> **“This option is ₹4,000 higher than the lowest displayed price, but it includes a second photographer, cinematic film and travel. Those costs are already included in the validated total.”**

Aura+ explains. Core decides/stores.

---

20 16 — 💬 PROTECTED DISCOVERY

Before booking:

```
CUSTOMER
```

↕

```
STARVNT
```

↕

```
VENDOR
```

Customer sees:

Premium Moments Photography

Vendor sees:

Wedding Opportunity #SV-28471

The customer's unnecessary personal details are hidden। The vendor's unnecessary private details are hidden। **Communication:**

STARVNT Secure Chat

---

21 17 — 📝 QUOTE

Vendor will submit the quote: Photography Base Service ₹42,000 Travel ₹0 Additional ₹6,000 Total ₹48,000 **Customer:** Review Quote **Actions:** Accept Ask Question Compare Reject

---

22 18 — 💳 MINIMUM RESERVATION

Customer:

Reserve this service

STARVNT will calculate: Booking Value Vendor Policy Service Type Payment Policy Business Rules Risk/Commercial Rules ↓ Minimum Booking Amount **Customer sees:**

Reserve today ₹X

This is not hardcoded as ₹5,000।

---

23 19 — 🔐 PAYMENT INITIATION

Customer: Reserve & Pay ₹X **Backend:**

```
PAYMENT_INITIATED
```

↓

```
PAYMENT_INTENT
```

↓

```
PAYMENT_GATEWAY
```

↓

```
PROCESSING
```

Customer will see:

Secure payment processing...

---

24 20 — 🛡️ PAYMENT VERIFICATION

Showing the payment success screen alone does not make the business state successful。 **Flow:**

```
PAYMENT GATEWAY
```

↓

```
SERVER VERIFICATION
```

↓

```
WEBHOOK
```

↓

```
RECONCILIATION
```

↓

```
PAYMENT_CONFIRMED
```

Core authority。 Not frontend authority。

---

25 21 — 🚨 PAYMENT SUCCESS ≠VENDOR PAYMENT

This is the biggest distinction。 Customer paid ₹8,000。 **System state:** PAYMENT_CONFIRMED = TRUE

This means:

> **Customer payment successfully verified.**

This does not mean: VENDOR_PAID = TRUE Vendor settlement is a separate lifecycle。

---

26 22 — 🔐 CUSTOMER PROTECTION

After verified payment:

```
CUSTOMER PAYMENT
```

↓

```
PAYMENT VERIFIED
```

↓

```
BOOKING PROTECTED
```

↓

```
VENDOR EXECUTION
```

Vendor dashboard: Payment Verified √ Settlement Pending **So that the vendor doesn't think:**

> **"Customer paid, therefore my money is already released."**

---

27 23 — 🎉 BOOKING CONFIRMATION

When payment verification + booking conditions pass:

```
PAYMENT_CONFIRMED
```

↓

```
BOOKING_VALIDATION
```

↓

```
BOOKING_CONFIRMED
```

Customer:

🎉 **Booking Confirmed**

Photography: Premium Moments Photography **Total:** ₹48,000 **Paid:** ₹X **Remaining:** ₹XX

---

28 24 — 🔓 BOOKING = RELATIONSHIP UNLOCK

Before booking: Customer ↕

```
STARVNT
```

↕ Vendor **After a verified booking: Customer ↕** Booked Vendor But not all data is automatically revealed. **Need-to-know access:** Assigned coordinator Operational contact Exact service location Arrival details Access instructions Schedule Service requirements

---

29 25 — 💍 EVENT CIRCLE UNLOCK

After the first verified booking:

Your Event is now active 🎉

An Event Circle will be created. **Members: Customer** Authorised family Authorised participants Booked vendors

```
STARVNT
```

---

30 26 — 📰 EVENT CIRCLE

Customer:

“Everything is finally coming together ❤️”

Photographer:

📸 Photography team ready for tomorrow.

Decorator:

🌸 Stage preparation completed.

Caterer:

🍽️ Final menu confirmed.

Everything is attached to the Event.

---

31 27 — 🔒 EVENT PRIVACY

Default: Private Customer + selected family Event Circle Authorised participants + relevant booked vendors Public If the Customer explicitly publishes. **Default:**

PRIVATE

---

32 28 — 📍 PROGRESSIVE LOCATION ACCESS

Before booking:

New Town, Kolkata

Operational stage:

Kisan Palace, New Town

After booking:

Exact service location

Near event:

Arrival point

Access instructions Contact person Service area **Principle:**

Reveal operational information when necessary, not unnecessarily early.

---

33 29 — 🏠 MY EVENT COMMAND CENTER

After an Event is created, Home will evolve. **Before:**

What are you planning?

After:

What needs your attention?

Example: My Daughter's Wedding 26 Nov · New Town · 500 Guests 68% Ready

---

34 30 — 🔴 ATTENTION ENGINE

Customer sees only meaningful actions: 🔴 Catering quote expires tomorrow 🟡 Decoration decision required 🟢 Photography confirmed 🟢 Payment verified This is not a notification dump. **This is:**

Attention Engine

---

35 31 — 📊 EVENT PROGRESS

Planning √ Vendors √ Booking 68% Payment 55% Execution Upcoming Completion — **Customer's simple question:**

Where are we?

---

36 32 — 💰 CONTINUOUS BUDGET

Customer:

Maximum ₹3 lakh.

STARVNT continuously evaluates: Committed Cost

1.

Pending Validated Cost

1.

Estimated Cost

1.

Potential Additional Cost **Example: Budget:** ₹3,00,000 **Estimated:** ₹2,78,000 **Remaining:** ₹22,000 **Customer:**

You're currently within your target budget.

---

37 33 — 🚨 OVER-BUDGET INTELLIGENCE

Suppose: Estimated: ₹3,12,000 **Aura+:**

"You're currently ₹12,000 above your target. I can explore decoration and catering alternatives that may bring the plan closer to ₹3 lakh."

Then:

```
BUDGET
```

↓

```
COMMITTED SERVICES
```

↓

```
ALTERNATIVES
```

↓

```
VALIDATED COST
```

↓

```
RECOMMENDATION
```

↓

```
CUSTOMER DECISION
```

Aura+ cannot automatically replace a vendor.

---

38 34 — 🤖 WHAT AM I MISSING?

Always accessible: Ask Aura+ **Customer:**

> **“What am I missing?”**

Aura+ checks actual Event state.

> **“Your essential arrangements are covered. Transport, accommodation and hospitality are still unconfirmed.”**

Customer:

> **“Arrange transport.”**

Directly opens the appropriate workflow.

---

39 35 — 🔔 UPDATES

Meaningful updates:

> **Photography quote expires tomorrow.**

> **Payment verified.**

> **Catering menu requires approval.**

> **Decoration vendor submitted an update.**

> **Photography team checked in.**

Not:

37 random notifications.

---

40 36 — 🗓️ EVENT TIMELINE

10 Nov Event Created 12 Nov Photography Selected 14 Nov Decoration Approved 18 Nov Catering Confirmed 20 Nov Payments Verified 25 Nov Final Coordination 26 Nov

```
EVENT DAY
```

27 Nov Completion

---

41 37 — 💬 CONTEXTUAL MESSAGES

Messages are not an independent generic inbox. **Structure:**

```
EVENT
```

↓

```
REQUIREMENT
```

↓

```
VENDOR
```

↓

```
QUOTE / BOOKING
```

↓

```
MESSAGE
```

Example: Photographer:

“We’ll arrive at 3 PM.”

Caterer:

“Final menu confirmed.”

STARVNT:

“Payment verified.”

Aura+:

> **“Your decoration options are ready.”**

---

42 38 — 🚨 NATURAL-LANGUAGE ISSUE HANDLING

Customer:

> **“My catering is not working.”**

Customer should NOT navigate: Events → Requirements → Catering → Vendor → Quote **Instead:**

```
CUSTOMER INTENT
```

↓

```
EVENT CONTEXT
```

↓

```
CATERING REQUIREMENT
```

↓

```
CURRENT BOOKING
```

↓

```
ISSUE DETECTION
```

↓

```
ALTERNATIVE DISCOVERY
```

↓

```
COST VALIDATION
```

↓

```
RECOMMENDATION
```

Aura+:

> **“I found two available alternatives for your event. Would you like me to compare them?”**

---

43 39 — 🔄 VENDOR CANCELLATION

Vendor cancels. **Internal:**

```
VENDOR_CANCELLED
```

↓

```
BOOKING_AT_RISK
```

↓

```
CUSTOMER_PROTECTION
```

↓

```
ALTERNATIVE_DISCOVERY
```

↓

```
VALIDATION
```

Customer sees:

Your photographer is no longer available for your event.

Then:

I've already checked replacement options.

---

44 40 — 🔁 REPLACEMENT

Customer gets: Option A Option B **Compare:** Availability Coverage Total cost Inclusions Operational suitability Customer decides. **Then normal:**

```
QUOTE
```

↓

```
APPROVAL
```

↓

```
PAYMENT / COMMERCIAL ADJUSTMENT
```

↓

```
BOOKING
```

---

45 41 — 💳 PAYMENT FAILURE

Customer payment fails. **Customer:**

> **Payment could not be completed.**

CTA: Try Again **Not:**

> **SQL transaction failed.**

Backend maintains correct state. **Duplicate gateway callback:**

> **safely ignored**

Duplicate booking:

> **safely prevented**

---

46 42 — 🔁 IDEMPOTENCY

Critical actions: Create Event Create Booking Payment Confirmation Webhook Event Circle Creation Notification Settlement Refund Even if the same request arrives multiple times:

> **One valid business action → One valid business outcome.**

---

47 43 — 🧑‍💼 VENDOR EXECUTION

Vendor-side lifecycle:

```
BOOKING_CONFIRMED
```

↓

```
PAYMENT_VERIFIED
```

↓

```
SERVICE_SCHEDULED
```

↓

```
CHECK_IN
```

↓

```
SERVICE_STARTED
```

↓

```
MILESTONE
```

↓

```
SERVICE_COMPLETED
```

↓

```
COMPLETION_SUBMITTED
```

---

48 44 — 🛡️ VENDOR COMPLETION CLAIM

Vendor said:

“Service complete.”

This is only: Completion Submitted **Not yet:** ❌ Completion Verified ❌ Settlement Eligible ❌ Vendor Settled No.

---

49 45 — 📸 COMPLETION EVIDENCE

Vendor may provide evidence according to the service: Check-in Check-out Photos Deliverables Documents Delivery proof Customer acknowledgement where applicable Service-specific evidence **Then:**

```
COMPLETION_SUBMITTED
```

↓

```
CORE VALIDATION
```

---

50 46 — 💰 THE FIVE CRITICAL FINANCIAL STATES

STARVNT will never conflate these:

```
PAYMENT_CONFIRMED
```

≠

```
SERVICE_COMPLETED
```

≠

```
COMPLETION_VERIFIED
```

≠

```
SETTLEMENT_ELIGIBLE
```

≠

```
VENDOR_SETTLED
```

This is the heart of the financial architecture.

---

51 47 — 🟢 SUCCESSFUL SERVICE

If all required conditions are satisfied:

```
SERVICE_COMPLETED
```

↓

```
COMPLETION_EVIDENCE
```

↓

```
CORE_VALIDATION
```

↓

```
COMPLETION_VERIFIED
```

↓

```
SETTLEMENT_ELIGIBILITY_CHECK
```

↓

```
SETTLEMENT_ELIGIBLE
```

↓

```
SETTLEMENT_EXECUTION
```

↓

```
VENDOR_SETTLED
```

Vendor will then receive settlement according to the applicable settlement infrastructure/policy.

---

52 48 — 🔴 VENDOR CLAIM

Vendor:

“My service is complete.”

System:

```
VENDOR CLAIM
```

↓

```
COMPLETION SUBMITTED
```

↓

```
VALIDATION
```

Three outcomes:

```
PASS
```

```
COMPLETION VERIFIED
```

↓

```
SETTLEMENT ELIGIBLE
```

↓

```
SETTLEMENT
```

```
REVIEW
```

```
COMPLETION UNCLEAR
```

↓

```
SETTLEMENT HOLD
```

↓

```
REVIEW
```

```
FAIL
```

```
SERVICE INCOMPLETE
```

↓

```
SETTLEMENT HOLD
```

↓

```
CUSTOMER PROTECTION
```

↓

```
RESOLUTION
```

---

53 49 — 🚨 CUSTOMER CLAIM

Customer:

> **“The photographer didn’t complete the agreed coverage.”**

Customer taps: Report an Issue **System:**

```
CUSTOMER ISSUE
```

↓

```
BOOKING
```

↓

```
SERVICE
```

↓

```
COMPLETION
```

↓

```
EVIDENCE
```

↓

```
VENDOR RESPONSE
```

↓

```
REVIEW
```

As long as the applicable dispute is unresolved:

> 🔒 **Settlement Hold**

---

54 50 — ⚖️ CUSTOMER CLAIM ≠ VENDOR GUILTY

This is equally important. **Customer making a claim does not mean:**

Vendor automatically failed

That will not happen. **Vendor making a claim does not mean:**

Vendor automatically succeeded

That will also not happen. **System needs:**

```
CUSTOMER EVIDENCE
```

1.

```
VENDOR EVIDENCE
```

1.

```
BOOKING TERMS
```

1.

```
SERVICE REQUIREMENTS
```

1.

```
COMPLETION CONDITIONS
```

1.

```
RELEVANT POLICY
```

Then resolution.

---

55 51 — 🛑 UNRESOLVED ISSUE

If the issue remains unresolved:

```
PAYMENT_CONFIRMED
```

↓

```
SERVICE_COMPLETED
```

↓

```
CUSTOMER_ISSUE
```

↓

```
SETTLEMENT_HOLD
```

Principle:

Unresolved applicable service dispute → Vendor settlement does not proceed.

---

56 52 — 💸 CUSTOMER REFUND / RESOLUTION

If, according to the applicable review, a refund is due:

```
SERVICE FAILURE / VALID CLAIM
```

↓

```
SETTLEMENT HOLD
```

↓

```
RESOLUTION
```

↓

```
REFUND DECISION
```

↓

```
REFUND EXECUTION
```

Customer:

Your refund has been initiated according to the applicable resolution.

Refunds are not automatic for all claims。

---

57 53 — 🔄 PARTIAL SERVICE FAILURE

Not all failures are binary！ **Example: Photography booked:** ₹48,000 **Agreed:** 8-hour coverage **Delivered:** 5 hours Then the system's resolution could be, per policy: Partial refund Partial settlement Service recovery Additional deliverable Replacement Other resolution Core/policy determines the outcome！ Aura+ can only explain/recommend！

---

58 54 — 🔄 REPLACEMENT AFTER FAILURE

Vendor failed before the event:

```
VENDOR_FAILURE
```

↓

```
CUSTOMER_PROTECTION
```

↓

```
ALTERNATIVE_VENDOR
```

↓

```
VALIDATION
```

↓

```
CUSTOMER_DECISION
```

↓

```
REPLACEMENT_BOOKING
```

Customer experience:

> **“We’ve found available alternatives for the same date and location.”**

---

59 55 — 🔥 EVENT SUCCESS

Event success doesn’t just mean:

> **Event date passed.**

No! STARVNT’s event outcome will be based on relevant service completion.

```
EVENT
|
├── VENUE
|     ✓
├── CATERING
|     ✓
├── PHOTOGRAPHY
|     ✓
├── DECORATION
```

```
|     ✓
├── MAKEUP
|     ✓
└── TRANSPORT
```

✓ **Then:**

```
SERVICE OUTCOMES
```

↓

```
CORE VALIDATION
```

↓

```
EVENT COMPLETION CONDITIONS
```

↓

```
EVENT_COMPLETED
```

---

60 56 — But not all vendor settlements will wait for event completion

This is very important। A photography service may be completed today. Album delivery 30 days later. Then the photographer's settlement policy may depend on the album deliverable. A caterer's service may be complete on the event day. **For a decorator:**

Setup + event execution + dismantling

may be required। **So:**

Settlement policy is service-specific.

Customer protection is universal। Completion criteria are service-specific।

---

61 57 — 📊 SETTLEMENT STATE MACHINE

```
NOT_ELIGIBLE
```

↓

```
ELIGIBILITY_CHECK
```

↓

```
ELIGIBLE
```

↓

```
SETTLEMENT_PENDING
```

↓

```
SETTLEMENT_PROCESSING
```

↓

```
VENDOR_SETTLED
```

Exception:

```
ELIGIBLE
```

↓

```
DISPUTED
```

↓

```
HOLD
```

↓

```
REVIEW
```

↓

```
RESOLUTION
```

---

62 58 — 🔐 SETTLEMENT AUTHORITY

The vendor frontend must never be able to set: settlementEligible = true The customer frontend must not be able to either. Aura+ must not be able to. **Vendor:**

Submit completion

Customer:

Report issue

Aura+:

Explain/recommend

Core/Policy:

Validate/decide

Settlement infrastructure:

Execute actual settlement

---

63 59 — 🧠 AURA+ ROLE

Aura+: Detect

“There may be a completion gap.”

Understand

“The agreed 8-hour coverage appears incomplete.”

Explain

“Settlement is currently under review.”

Recommend

“Would you like me to explore replacement options?”

Aura+: ❌ Cannot authorize payment ❌ Cannot verify payment ❌ Cannot verify completion ❌ Cannot authorize settlement ❌ Cannot decide refund independently

---

64 60 — 💳 CUSTOMER PAYMENT VS FUND CUSTODY

Four responsibilities are distinct in the architecture:

```
PAYMENT VERIFICATION
```

≠

```
FUNDS CUSTODY
```

≠

```
SETTLEMENT ELIGIBILITY
```

≠

```
SETTLEMENT EXECUTION
```

Developers must understand this very clearly। STARVNT itself will not assume an “escrow” implementation। **Actual fund flow will depend on:** Selected payment provider Marketplace/ payment architecture Settlement mechanism Applicable business structure Applicable legal/compliance requirements **What the software must do:**

> **Accurately model payment truth + booking protection + completion state + settlement decision lifecycle।**

---

65 61 — 🖥️ EVENT LIVE

On the event day the customer interface will change। **Normal:**

> **Plan your event**

Event day: 🔴 LIVE EVENT **Example:** 08:00 🟢 Decoration team arrived 09:42 🟢 Photography checked in 10:15 🟡 Catering setup 16:00 ⚪ Guest arrival 18:00 ⚪ Wedding ceremony

---

66 62 — 🤖 “IS EVERYTHING ON TRACK?”

Customer:

> **“Is everything on track?”**

Core data: DECORATION = COMPLETED PHOTOGRAPHY = ARRIVED CATERING = SETUP_IN_PROGRESS CEREMONY = 18:00 **Aura+:**

> **“Yes. Decoration is complete, photography has checked in, and catering setup is currently in progress. Your ceremony is scheduled for 6 PM.”**

No hallucination.

---

67 63 — 🖥️ STARVNT EVENT LIVE SCREEN

Same Event. Different experience. Customer App Plan + Track + Decide Vendor OS Operate + Update + Deliver Venue Screen Celebrate + Display + Impress Core Truth

---

68 64 — ONE EVENT, MULTIPLE EXPERIENCES

```
ONE EVENT
|
┌──────────┼──────────┐
```

↓↓↓

```

```

↓

```
MODERATION / APPROVAL
```

↓

```
PUBLISHED
```

↓

```
LIVE SCREEN ELIGIBLE
```

Raw upload:

❌ **Never directly to LED.**

---

70 66 — 🎉 EVENT COMPLETION

Completion should not be:

Date passed.

Instead:

```
SERVICE COMPLETION
```

↓

```
EVIDENCE
```

↓

```
CORE VALIDATION
```

↓

```
RELEVANT SERVICES COMPLETE
```

↓

```
EVENT COMPLETION CONDITIONS
```

↓

```
EVENT_COMPLETED
```

Customer: 🎉 Your Event is Complete!

---

71 67 — 💎 EVENT MEMORY

Operational event becomes:

Event Memory

Example: Your Event Story 📸 428 Photos 🎥 12 Videos 📝 18 Updates ❤️ 126 Reactions ⭐ 5 Vendor Experiences **Tabs:** Highlights | Photos | Videos | Updates

---

72 68 — 📖 AUTOMATIC EVENT STORY

STARVNT can organize: Planning

Your journey began...

The Build-up

Your vendors joined...

Event Day

Teams arrived and the celebration began...

The Celebration

Your special moments...

Memories

Photos + Videos + Wishes

Customer can edit/share where permitted.

---

73 69 — 🔁 EVENT NEVER DISAPPEARS

Completed Event:

```
EVENT
```

↓

```
COMPLETED
```

↓

```
MEMORY
```

Customer later:

> **“Show me our wedding memories.”**

STARVNT understands the context.

---

74 70 — 🎂 SECOND EVENT

Customer:

> **“Now I want to plan my daughter’s birthday.”**

System:

```
CUSTOMER
```

↓

```
NEW EVENT
```

↓

```
EVENT CONTEXT
```

↓

```
REQUIREMENTS
```

↓

```
VENDOR DISCOVERY
```

↓

```
BOOKING
```

No separate Birthday backend. No separate Wedding backend. Same universal architecture.

---

75 71 — 🧭 MULTI-EVENT HOME

Customer: My Events 💍 Daughter’s Wedding Completed 🎂 Daughter’s Birthday Planning 🏠 Anniversary Upcoming Each event has its own context. Aura+ relationship continuous.

---

76 72 — 📱 CUSTOMER NAVIGATION

Primary navigation intentionally small: 🏠 Home What matters now. 💍 Events All events. ✨ Aura+ Think with me. 🔔 Updates Attention. 👤 Me Profile/privacy/settings. **Do not make these primary nav:** Requirements Vendors Quotes Payments Budget Timeline Documents **These:**

Inside the Event Context.

---

77 73 — 🧠 CUSTOMER LANGUAGE → SYSTEM ACTION

Customer:

“My catering is not working.”

STARVNT will understand:

```
CUSTOMER INTENT
```

↓

```
CURRENT EVENT
```

↓

```
CATERING REQUIREMENT
```

↓

```
CURRENT VENDOR
```

↓

```
CURRENT BOOKING
```

↓

```
ISSUE
```

↓

```
ALTERNATIVES
```

Customer will not navigate technically.

---

78 74 — 🧠 CUSTOMER DOES NOT OPERATE MODULES

Customer should not feel:

“I’m in the Requirement Management module right now.”

Rather:

“I’m planning my daughter’s wedding.”

This is product abstraction.

---

79 75 — 🛡️ SECURITY

Customer can only view authorised Events. **Other customer:**

❌ Access denied

Other organisation:

❌ Access denied

Vendor:

Only authorised opportunities/bookings.

Frontend:

Never security boundary.

---

80 76 — 🔐 ACCESS CONTROL

Before booking: Customer identity limited. Vendor identity visible at business level. **After booking:** Need-to-know operational access. **Event Circle:** Permission-based. **Live Screen:** Approved content only. **Memory:** Customer-controlled sharing。

---

81 77 — 🔁 FAILURE MATRIX

STARVNT must handle at least these failures: Failure Expected Outcome Payment failure Retry safely Duplicate webhook One outcome Duplicate booking One booking Duplicate event One valid event Vendor cancellation Protection + replacement/refund path Customer issue Settlement hold/review Service incomplete Resolution Automation failure Retry/recovery Invalid state Rejected Cross-tenant access Blocked Unauthorized vendor access Blocked Duplicate Event Circle One Circle Duplicate notification Idempotent Unapproved content Cannot reach Live Screen

---

82 78 — 🧪 GOLDEN CUSTOMER E2E

Fresh customer. No pre-created fake state. **Customer says:**

> **“My daughter’s wedding is on 26 November in New Town. Around 500 guests. My budget is ₹3 lakh.”**

Then:

```
CUSTOMER SENTENCE
```

↓

```
AURA+ UNDERSTANDING

```

↓

```
EVENT MEMORY
```

---

83 79 — 🔥 GOLDEN FAILURE E2E

Second test in the same prototype: Photography booked. Customer paid. Vendor scheduled. **Then:**

Vendor cancels.

System:

```
VENDOR_CANCELLED
```

↓

```
BOOKING AT RISK
```

↓

```
CUSTOMER PROTECTION
```

↓

```
ALTERNATIVE SEARCH
```

↓

```
VALIDATED OPTIONS
```

↓

```
CUSTOMER DECISION
```

↓

```
REPLACEMENT
```

Or: Vendor service incomplete:

```
SERVICE_COMPLETED CLAIM
```

↓

```
CUSTOMER ISSUE
```

↓

```
SETTLEMENT HOLD
```

↓

```
REVIEW
```

↓

```
RESOLUTION
```

↓

```
REFUND / PARTIAL RESOLUTION /
OTHER APPLICABLE OUTCOME
```

---

84 80 — 💰 GOLDEN PAYMENT/SETTLEMENT TEST

Suppose: Quote: ₹48,000 **Customer reservation:** ₹8,000 **Test:** ₹8,000 CUSTOMER PAYMENT ↓

```
PAYMENT VERIFIED
```

↓

```
BOOKING CONFIRMED
```

↓

```
VENDOR EXECUTES
```

↓

```
SERVICE COMPLETED
```

↓

```
COMPLETION SUBMITTED
```

↓

```
CUSTOMER CLAIM
```

↓

```
SETTLEMENT HOLD
```

In this situation: Vendor:

❌ Not settled

Customer:

Payment protection/review state

Core:

Dispute/hold state

Then, depending on the resolution:

```
VALIDATED SUCCESS
```

↓

```
SETTLEMENT ELIGIBLE
```

↓

```
SETTLEMENT
```

Or:

```
VALIDATED FAILURE
```

↓

```
REFUND / PARTIAL /
OTHER RESOLUTION
```

---

85 81 — 🏆 THE BIG STARVNT DIFFERENTIATOR

Traditional marketplace: Customer ↓ Search ↓ Vendor ↓ Pay ↓ Vendor **STARVNT intended model: Customer** ↓ Tell STARVNT ↓ Understand ↓ Plan ↓ Validate ↓ Choose ↓ Pay ↓ Protected Booking ↓ Vendor Executes ↓ Outcome Verified ↓ Settlement / Resolution ↓ Event Complete ↓ Memory

---

86 82 — ⭐ FIVE FINANCIAL TRUST RULES

Rule 1

Customer Payment ≠ Vendor Settlement

Rule 2

Payment Verified ≠ Service Completed

Rule 3

Vendor Completion Claim ≠ Completion Verified

Rule 4

Completion Verified ≠ Automatically Settled

Rule 5

Unresolved applicable dispute ⟶ Settlement Hold

---

87 83 — ⭐ FIVE CUSTOMER PROTECTION RULES

Rule 6

Customer payment should remain subject to the applicable booking, completion and settlement framework.

Rule 7

Vendor cannot self-authorize settlement.

Rule 8

Customer claim does not automatically establish vendor fault; it triggers review.

Rule 9

Validated service failure can trigger applicable customer protection such as refund, partial refund, replacement or another defined resolution.

Rule 10

Actual fund movement must follow the selected payment/settlement infrastructure and applicable legal/compliance structure.

---

88 84 — 🧠 THREE INTELLIGENCE LAYERS

Aura+

Think with me.

Understand Analyse Explain Recommend My Event

Show me what matters.

Plan Requirements Budget Bookings Timeline Execution Event Circle

Connect, experience and remember.

Coordinate Share Celebrate Remember

---

89 85 — CORE TRUST LAYER

Under everything:

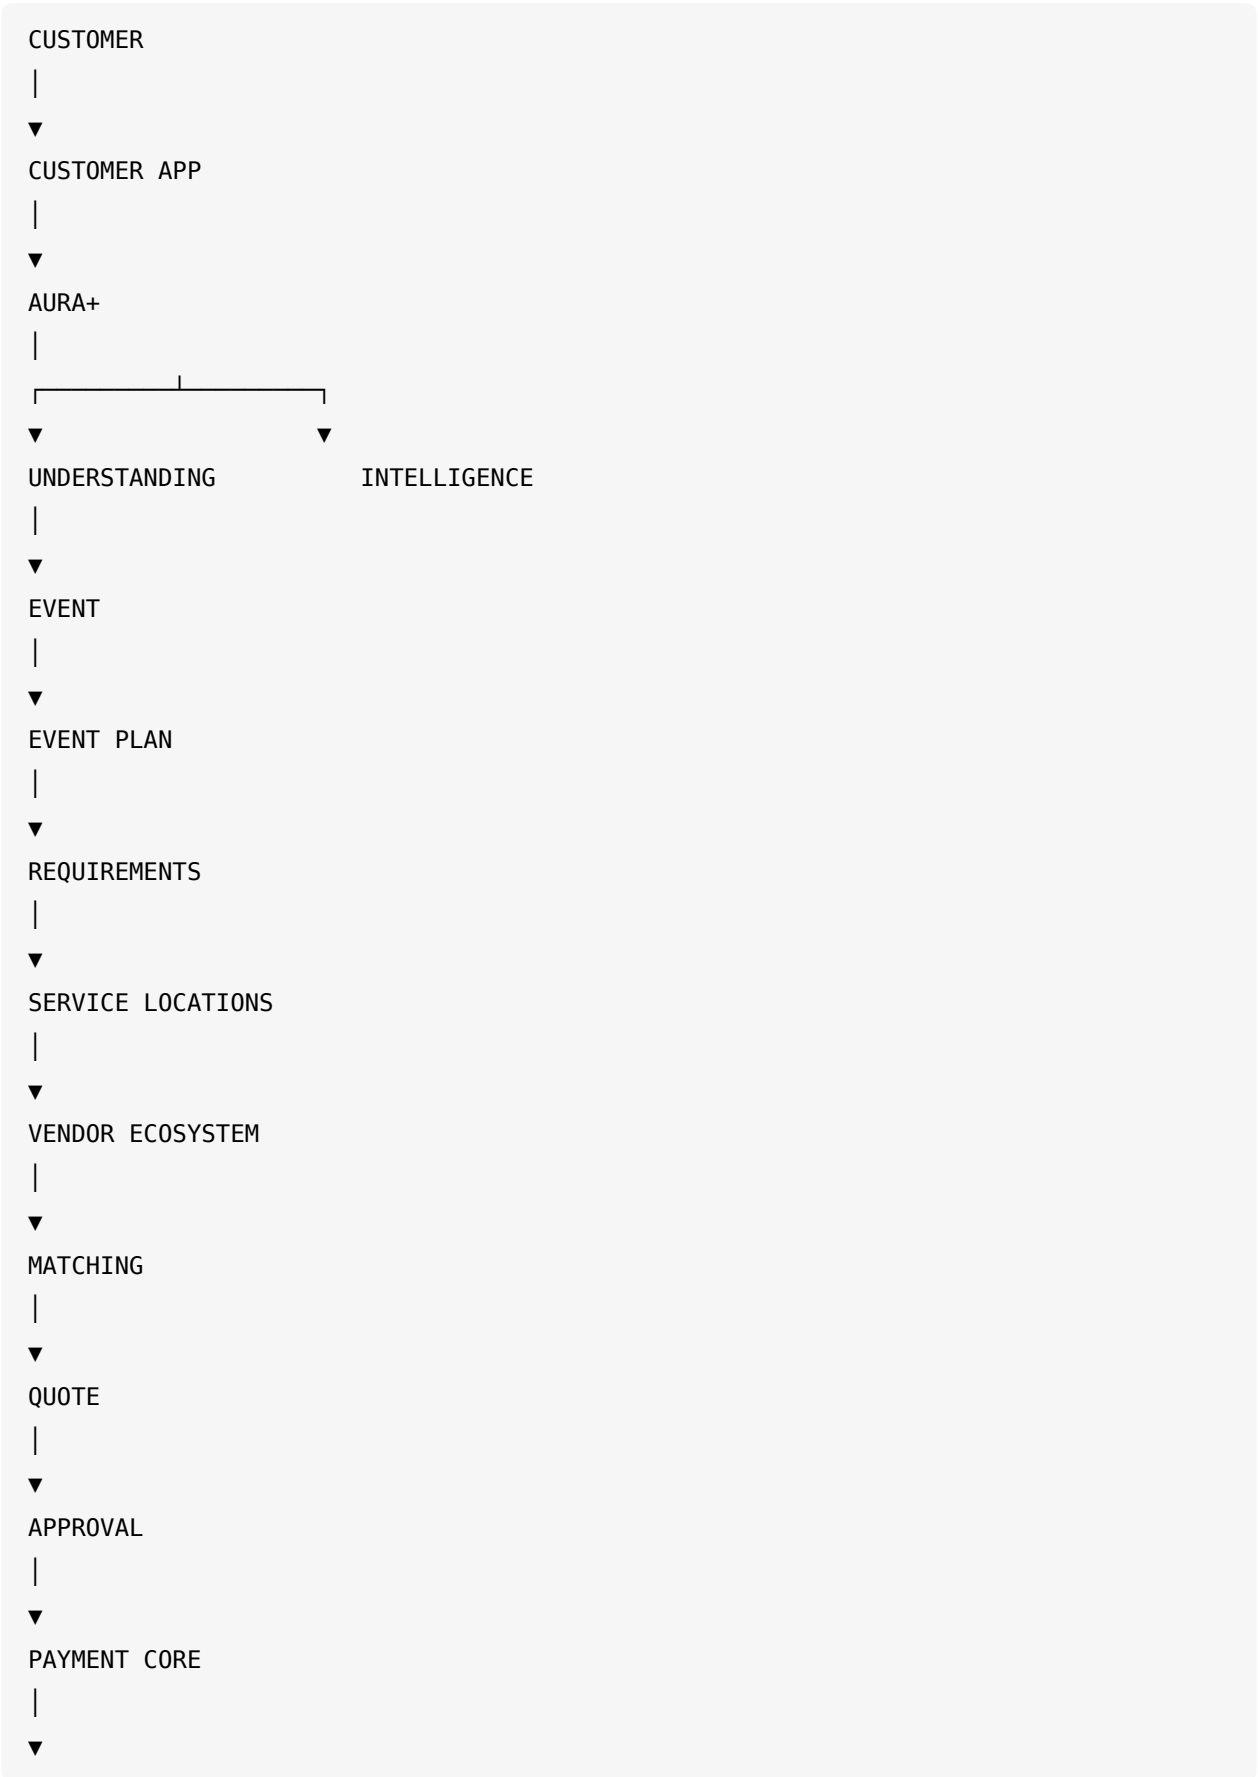

```
CORE
|
├── Identity
├── Organization
├── Event
├── Requirement
├── Vendor
├── Quote
├── Booking
├── Payment
├── Execution
├── Completion
├── Settlement
├── Event Circle
├── Audit
└── Authorization
```

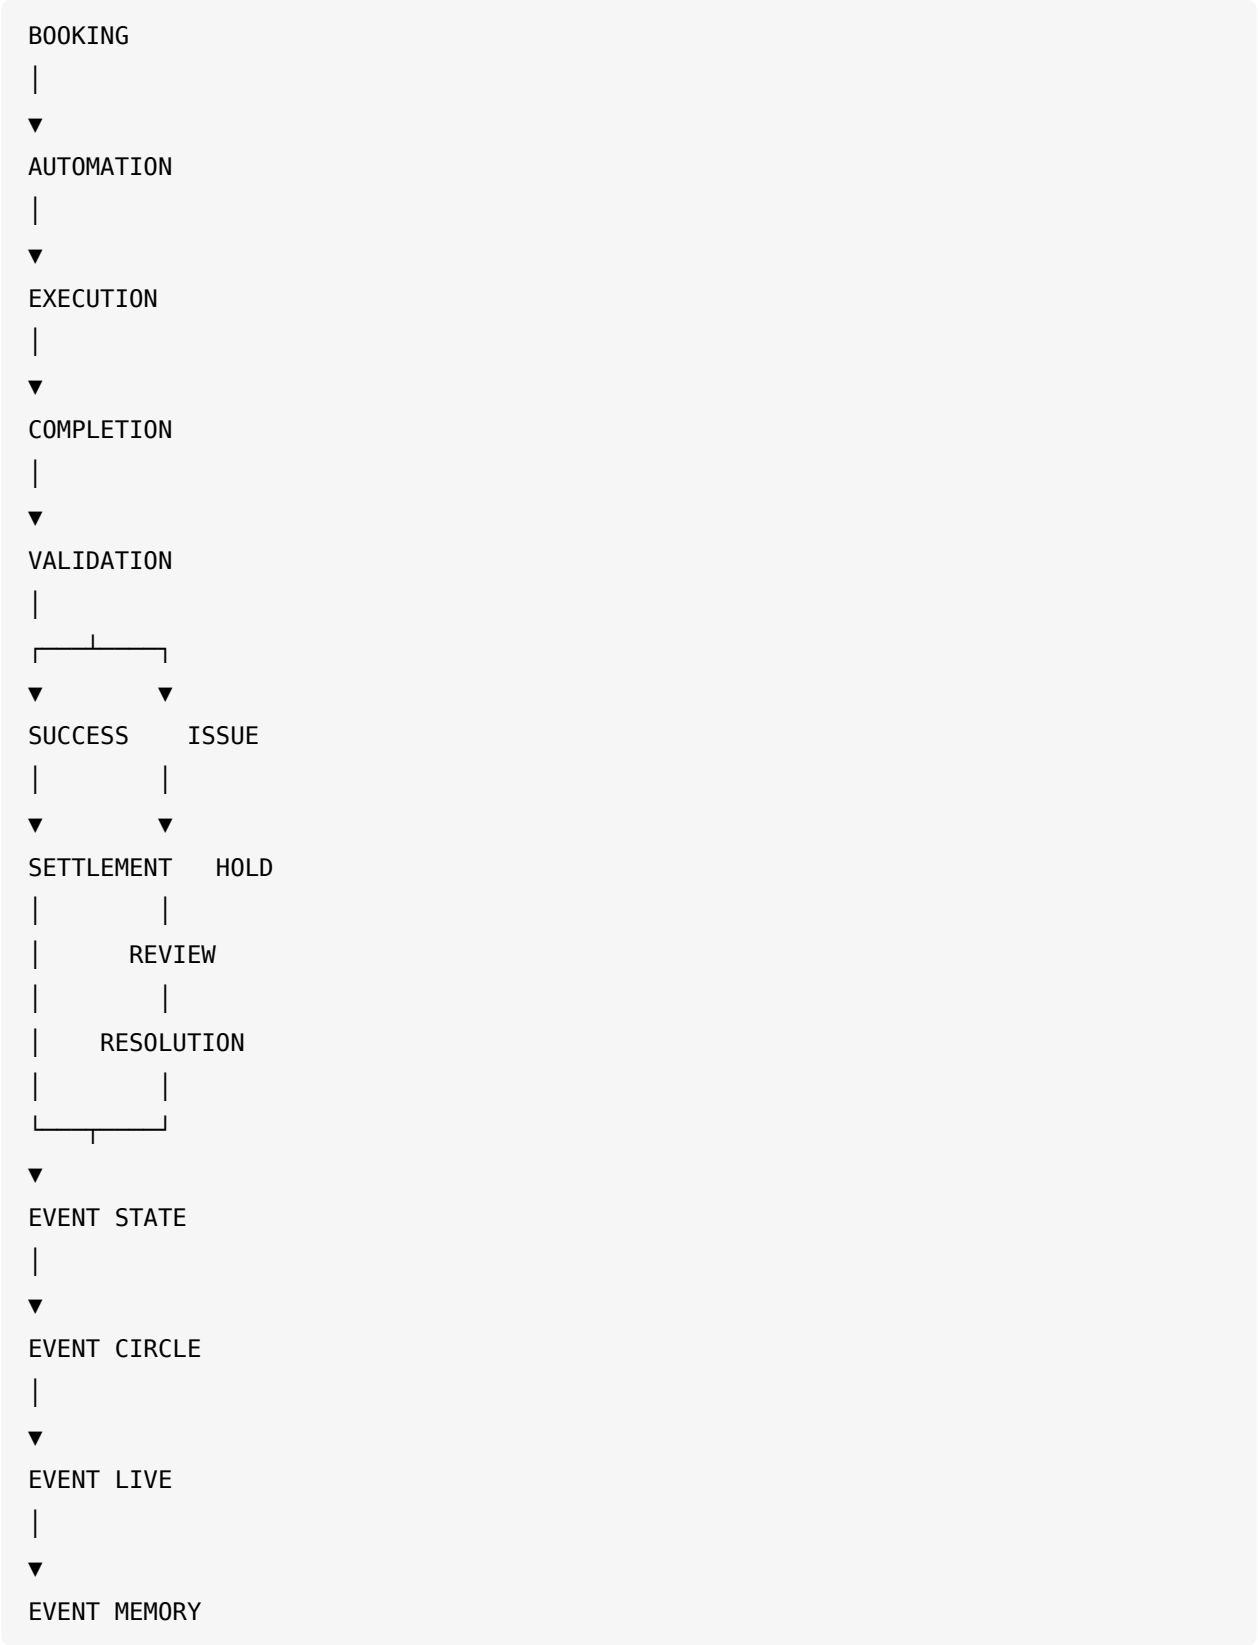

Core is:

What is officially true?

---

90 86 — COMPLETE SYSTEM MODEL

91 87 — ⭐ THE THREE SIMPLE CUSTOMER FEELINGS

To the customer, the whole system should create just three feelings. 🧠 Aura+

“Think with me.”

💍 My Event

“Show me what matters.”

📰 Event Circle

“Connect, experience and remember.”

---

92 88 — FINAL NORTH STAR

```
IDEA
```

↓

```
TELL
```

↓

```

↓

```
SETTLE / RESOLVE
```

↓

```
COMPLETE
```

↓

```
LIVE
```

↓

```
REMEMBER
```

↓

```
NEXT EVENT
```

And in customer-facing language:

Tell us.

We'll understand.

We'll help you plan.

We'll find suitable options.

You decide.

We'll secure the booking.

We'll help coordinate the event.

We'll protect the transaction through the applicable completion and resolution process.

We'll help you experience the event.

And we'll preserve the memory.

🔥 STARVNT's most important PRODUCT PRINCIPLE **I'd lock it into one line:**

The customer should never have to manage the complexity that STARVNT can manage for them.

And for payment/trust:

Customer payment secures the booking; vendor settlement follows the defined successful service outcome and verification process.

And for failures:

If the booked service fails, customer protection and resolution come before vendor settlement.

And for architecture:

Aura+ can understand and recommend. Core must determine what is officially true.

And for the whole product:

The complexity belongs to STARVNT.

The decisions belong to the customer. The truth belongs to Core. The intelligence belongs to Aura+. The outcome determines settlement. This is what turns your 12-screen UI into a true STARVNT Customer E2E Product. Yes, Boss. Now let's take it to a level where we can lock the whole thing together. Combine your 12-screen prototype + previous Customer E2E + Payment Protection + Event Circle + Vendor Execution — and STARVNT is no longer just a "Customer App". **This will be:**

93 🚀 STARVNT CUSTOMER E2E PRODUCT BLUEPRINT v1.0

Personal Event Assistant → Commerce → Protected Booking → Execution → Outcome → Settlement → Event Memory

You tell us what you're planning. We'll figure out the rest.

```
0. THE STARVNT PRODUCT CONTRACT
```

STARVNT's entire architecture will stand on four authority principles: 🧠 Aura+ Understands. Explains. Recommends. 🏛️ Core Owns authoritative business truth. 📜 Policy Engine Determines which rules apply. 💳 Payment / Settlement Infrastructure Processes actual money movement according to the applicable financial structure. **Then:** 🧑‍💼 Vendor Executes the service. 📸 Evidence Proves what happened. 🛡️ Customer Protection Handles risk, issue, dispute and recovery. 💰 Settlement Follows validated outcome, not merely customer payment.

```
1. THE COMPLETE CUSTOMER JOURNEY
```

To the customer, the journey:

TELL → UNDERSTAND → PLAN → DISCOVER → COMPARE → DECIDE → RESERVE → PAY → BOOK → CONNECT → COORDINATE → EXPERIENCE → COMPLETE → REMEMBER

But in the backend: Customer Intent ↓ **Aura+** ↓ Event Context ↓ Requirement Resolution ↓ Service Location ↓ Vendor Ecosystem ↓ Eligibility ↓ Commercial Calculation ↓ Quote ↓ Customer Decision ↓ Reservation ↓ Payment ↓ Verification ↓ Booking ↓ Protection ↓ Execution ↓ Evidence ↓ Validation ↓ Settlement / Recovery ↓ Event Completion ↓ Event Memory

---

2. SCREEN 01 — WELCOME

Keep the current image as the first screen. Customer sees

```
STARVNT
```

Life's special moments, made simple.

Primary: Get Started **Secondary:** Sign In But right after Get Started, it's not a traditional dashboard.

---

3. SCREEN 02 — WHAT ARE YOU PLANNING?

This is STARVNT's actual product entry. Primary question

What are you planning?

Customer: 🎤 Speak ⌨️ Type 📎 Add photo 🎥 Add video 🖼️ Add reference **Examples:**

“My daughter’s wedding…”

“I want to plan a birthday.”

“We are organising a corporate event.”

“I need to arrange a Puja for 200 people.”

“Something else.”

Principle Conversation becomes the form. You must not make the Customer start the event by giving a 15-field registration form.

---

4. SCREEN 03 — AURA+ INTENT UNDERSTANDING
Customer:

“My daughter’s wedding is on 26 November in New Town for around 500 guests. My budget is ₹3 lakh.”

Aura+ extracts: Event Type Wedding Date 26 November Destination New Town Guest Count 500 Budget ₹3,00,000 **If customer says:**

“We already have the venue and need photography and decoration.”

Then: Known Requirements ⟶ Photography ⟶ Decoration **Already Arranged** ⟶ Venue

---

```
5. AURA+ INTERNAL CONTEXT MODEL
```

Every customer statement should be classified internally.

```
CUSTOMER INPUT
|
├── KNOWN
├── CONFIRMED
├── INFERRED
├── MISSING
├── AMBIGUOUS
└── RECOMMENDED
```

Important distinction Inferred ≠ Confirmed. If Aura+ thinks the customer probably needs accommodation, that does not mean:

Accommodation = Booked

It means:

Accommodation = Recommended / Unconfirmed

---

6. SCREEN 04 — "HERE'S WHAT I UNDERSTOOD"

Customer sees:

Got it. Here's what I understood.

My Daughter's Wedding 📅 26 November 📍 New Town, Kolkata 👥 500 guests 💰 ₹3,00,000 budget Already arranged √ Venue You mentioned √ Photography √ Decoration √ Catering **CTA:**

Build My Event Plan ✨

Secondary:

Edit anything

Customer remains in control.

```
7. SMART CLARIFICATION ENGINE
```

STARVNT should not ask everything at once. **Instead:**

```
UNDERSTAND
```

↓

```
CHECK CONTEXT
```

↓

```
FIND MISSING CRITICAL DATA
```

↓

```
ASK ONE USEFUL QUESTION
```

↓

```
UPDATE CONTEXT
```

↓

```
RECHECK
```

Example:

“Do you already have a venue?”

Customer:

“Yes, Kisan Palace.”

System updates: Venue Status = CUSTOMER_PROVIDED **Then:**

“Would you like us to arrange catering too?”

Customer:

“Yes.”

Now: Catering Status = REQUIRED

```
8. EVENT CREATION
```

Once sufficient information exists:

Your event is taking shape. ✨

Event My Daughter’s Wedding 26 November New Town, Kolkata 500 Guests ₹3,00,000 **CTA:**

Build My Event Plan

Backend:

```
CUSTOMER
```

↓

```
EVENT
```

↓

```
EVENT TYPE
```

↓

```
DATE
```

↓

```
DESTINATION
```

↓

```
GUEST CONTEXT
```

↓

```
BUDGET CONTEXT
```

From this point forward:

Every customer action belongs to an Event.

```
9. EVENT PLAN ENGINE
```

STARVNT generates a living Event Plan. Essential — Must Have 🔴 Venue 🔴 Catering 🔴 Photography 🔴 Decoration 🔴 Makeup 🔴 Sound 🔴 Ceremony / Purohit Recommended — Consider 🟡 Transport 🟡 Accommodation 🟡 Hospitality 🟡 Invitation 🟡 Anchor 🟡 Entertainment 🟡 Backup planning Optional — Enhance ⚪ Photo Booth ⚪ Special Effects ⚪ Live Streaming ⚪ Premium Entertainment

The product language must be:

STARVNT recommends. You decide.

Not:

“You must purchase these services.”

---

10. REQUIREMENT — THE CENTRAL OPERATIONAL OBJECT

This is one of the most important architecture decisions.

```
EVENT
|
├── Requirement: Photography
├── Requirement: Decoration
├── Requirement: Catering
├── Requirement: Makeup
└── Requirement: Transport
```

Therefore:

One Event ≠ One Booking

Instead:

One Event = Many Requirements = Many possible Quotes = Many Bookings

---

```
11. REQUIREMENT LIFECYCLE
```

A requirement can move through:

```
IDENTIFIED
```

↓

```
CLARIFICATION_REQUIRED
```

↓

```
READY
```

↓

```
DISCOVERING
```

↓

```
OPTIONS_FOUND
```

↓

```
QUOTE_REQUESTED
```

↓

```
QUOTE_RECEIVED
```

↓

```
CUSTOMER_REVIEW
```

↓

```
SELECTED
```

↓

```
BOOKED
```

↓

```
SCHEDULED
```

↓

```
EXECUTING
```

↓

```
COMPLETION_SUBMITTED
```

↓

```
COMPLETION_VERIFIED
```

↓

```
CLOSED
```

This gives the entire commerce/execution lifecycle one continuous thread.

```
12. SERVICE LOCATION
```

This is fundamental. STARVNT must not match vendors simply based on:

Customer's location.

Instead:

Where does this service actually need to happen?

Example:

```
EVENT
```

Wedding

```
|
├── Photography
|     └── Kisan Palace
|
├── Makeup
|     └── Bridal Room
|
├── Catering
|     └── Banquet Hall
|
├── Decoration
|     └── Stage + Lawn
|
└── Transport
└── Airport → Venue
```

Therefore:

Event Location ≠ Service Location

```
13. VENDOR DISCOVERY
```

Customer taps:

Find Photography Options

Backend:

```
REQUIREMENT
↓
SERVICE LOCATION
↓
SERVICE
↓
COVERAGE
↓
AVAILABILITY
↓
CAPACITY
↓
ELIGIBILITY
↓
TRAVEL
↓
ADDITIONAL COST
↓
TOTAL COST
↓
SUITABILITY
↓
RANKING
```

Customer sees only the useful result.

We found 3 suitable options for you.

```
14. LOWEST VALIDATED TOTAL COST
```

Suppose: Vendor A Base ₹44,000 Travel ₹3,000 Additional ₹2,000 Total ₹49,000 Vendor B Base ₹48,000 Travel Included Additional Included Total ₹48,000 **STARVNT does not simply compare:**

Advertised price

It compares:

Validated Total Cost

Among vendors that genuinely satisfy the requirement.

```
15. CUSTOMER-FACING RECOMMENDATION
```

Example: Premium Moments Photography ⭐ 4.8 ₹48,000 ✓ 2 Photographers ✓ Full-day coverage ✓ Cinematic film ✓ Travel included ✓ 500+ edited photos **Badge:**

Best Validated Option

CTA: Select **Secondary:** Compare

---

16. “WHY THIS OPTION?”
Customer:

“Why are you recommending this?”

Aura+:

“This option costs ₹4,000 more than the lowest displayed price, but includes a second photographer, cinematic film and travel. Those costs are already included in the validated total.”

This is the correct relationship: Core / Commercial Engine ↓ Facts + Costs + Eligibility ↓ **Aura+** ↓ Explanation Aura+ does not invent commercial truth.

```
17. PROTECTED DISCOVERY
```

Before booking:

```
CUSTOMER
```

↓

```
STARVNT
```

↓

```
VENDOR
```

Customer sees vendor's business identity. **Vendor sees:**

Wedding Opportunity #SV-28471

rather than unnecessary customer PII. **Communication:**

STARVNT Secure Chat

This helps preserve the transaction relationship inside STARVNT.

```
18. QUOTE
```

Vendor submits: Photography

```
_____
```

Base Service ₹42,000 Travel ₹0 Additional ₹6,000

```
_____
```

Total ₹48,000 **Quote lifecycle:**

```
DRAFT
```

↓

```
SUBMITTED
```

↓

```
CUSTOMER REVIEW
```

↓

```
APPROVED
```

Alternative:

```
REJECTED
EXPIRED
```

```
19. RESERVATION
```

Customer:

Reserve this service

System calculates: Booking Value ₹48,000 Minimum Reservation ₹X Remaining ₹48,000 - ₹X Important There should be no hardcoded ₹5,000 rule. **Minimum reservation should be:**

Policy-driven

and potentially dependent on service/vendor/booking conditions.

---

20. THE MOST IMPORTANT PART — CUSTOMER PAYMENT
Customer pays to secure the booking. **Flow:**

```
RESERVATION REQUESTED
```

↓

```
PAYMENT INTENT
```

↓

```
PAYMENT GATEWAY
```

↓

```
PROCESSING
```

↓

```
SERVER VERIFICATION
```

↓

```
WEBHOOK / RECONCILIATION
```

↓

```
PAYMENT CONFIRMED
```

But: PAYMENT CONFIRMED ≠ VENDOR SETTLED This distinction must be non-negotiable.

```
21. PAYMENT STATE MACHINE
```

Payment itself:

```
PAYMENT_INITIATED
```

↓

```
PAYMENT_PROCESSING
```

↓

```
PAYMENT_CONFIRMED
```

Failure:

```
PAYMENT_FAILED
```

Other possible states:

```
PAYMENT_REVERSED
PAYMENT_REFUNDED
```

The payment state must remain separate from Booking state.

```
22. BOOKING STATE MACHINE
```

```
RESERVATION_REQUESTED
```

↓

```
PAYMENT_CONFIRMED
```

↓

```
BOOKING_CONFIRMED
```

↓

```
SERVICE_SCHEDULED
```

↓

```
SERVICE_STARTED
```

↓

```
SERVICE_COMPLETED
```

Again:

Payment lifecycle ≠ Booking lifecycle.

```
23. THE STARVNT CUSTOMER PROTECTION PRINCIPLE
```

The strongest rule:

Customer payment is not the same thing as vendor settlement.

Customer payment means:

Payment has been successfully processed and verified according to the applicable payment flow.

Vendor settlement means:

The booked service has reached the applicable settlement condition.

Therefore:

```
CUSTOMER PAYMENT
```

↓

```
PAYMENT VERIFIED
```

↓

```
BOOKING PROTECTED
```

↓

```
VENDOR EXECUTES
```

↓

```
OUTCOME VALIDATED
```

↓

```
SETTLEMENT ELIGIBILITY
```

↓

```
SETTLEMENT
```

```
24. VENDOR CANNOT SELF-RELEASE MONEY
```

Vendor may submit:

Service Completed

But cannot submit:

Settlement Approved

Vendor may provide evidence. Core decides whether the completion condition is satisfied.

```
25. COMPLETION EVIDENCE
```

Vendor can submit: Check-in Check-out Service completion Photos Documents Deliverables Delivery confirmation Milestone evidence Customer acknowledgement where applicable Category-specific proof

Flow:

```
VENDOR
```

↓

```
COMPLETION SUBMITTED
```

↓

```
EVIDENCE
```

↓

```
CORE VALIDATION
```

```
26. FIVE CRITICAL FINANCIAL STATES
```

These must never be collapsed:

```
PAYMENT_CONFIRMED
```

≠

```
SERVICE_COMPLETED
```

≠

```
COMPLETION_VERIFIED
```

≠

```
SETTLEMENT_ELIGIBLE
```

≠

```
VENDOR_SETTLED
```

This single distinction can become one of STARVNT's strongest trust architecture principles.

```
27. SERVICE-SPECIFIC SETTLEMENT
```

A critical refinement:

Vendor settlement should not always wait for the entire Event to be completed.

Example: Photographer Coverage completed + applicable deliverables condition met → Settlement eligibility Caterer Food/service completed according to booking → Settlement eligibility Decorator Setup + event service + dismantling → Settlement eligibility Purohit Agreed ceremony/service completed → Settlement eligibility **Therefore:**

Customer protection is universal. Completion rules are service-specific.

```
28. POLICY ENGINE
```

Policy answers:

What rules apply?

Examples: Minimum reservation amount Cancellation Reschedule Refund eligibility Partial refund Completion requirement Dispute window Settlement delay Vendor cancellation Replacement Evidence requirements Service-specific settlement conditions **So:**

```
CORE
```

“What is true?”

```
POLICY
```

“What rule applies?”

```
AURA+
```

“How should we explain/recommend?”

```
PAYMENT INFRA
```

“How is money actually processed?”

```
29. CUSTOMER PROTECTION CASE
```

Make Customer Protection a real system object.

```
PROTECTION CASE
|
├── Customer
├── Event
├── Requirement
├── Booking
├── Vendor
```

```
├── Payment
├── Completion
├── Evidence
├── Issue
├── Policy
├── Resolution
└── Audit Trail
```

Lifecycle:

```
NONE
```

↓

```
AT_RISK
```

↓

```
PROTECTED
```

↓

```
ISSUE_REPORTED
```

↓

```
UNDER_REVIEW
```

↓

```
RESOLUTION_PROPOSED
```

↓

```
RESOLVED
```

```
30. CUSTOMER ISSUE
```

Customer says:

“The photographer left before the agreed coverage was completed.”

Customer should simply tap:

Report an Issue

System automatically connects: Issue ↓ Event ↓ Requirement ↓ Booking ↓ Vendor ↓ Payment ↓ Completion ↓ Evidence No technical navigation required.

```
31. SETTLEMENT HOLD
```

If there is an unresolved service issue:

```
SERVICE ISSUE
```

↓

```
PROTECTION CASE
```

↓

```
SETTLEMENT HOLD
```

↓

```
REVIEW
```

Important:

Vendor claim does not automatically release money.

But equally:

Customer claim does not automatically prove vendor fault.

The system reviews the applicable evidence, policy and facts.

```
32. RESOLUTION
```

Possible outcome depends on applicable policy and facts:

```
RESOLUTION
├── Service accepted
├── Vendor settlement
├── Partial settlement
├── Refund
├── Partial refund
├── Replacement
└── Other approved remedy
```

The exact financial mechanism should be implemented according to STARVNT's actual payment/settlement infrastructure and applicable legal/compliance structure.

```
33. VENDOR CANCELLATION
```

Example: Photography vendor cancels two days before event. **Customer sees:**

Your photographer is no longer available for your event.

Then:

We've already checked alternatives.

System:

```
VENDOR_CANCELLED
```

↓

```
BOOKING_AT_RISK
```

↓

```
CUSTOMER_PROTECTION
```

↓

```
ALTERNATIVE_DISCOVERY
```

↓

```
ELIGIBILITY
```

↓

```
TOTAL COST
```

↓

```
OPTIONS
```

↓

```
CUSTOMER DECISION
```

Customer can then choose the applicable replacement/refund path.

```
34. EVENT CIRCLE
```

After verified booking:

Your Event is now active 🎉

Create: Event Circle **Participants can include: Customer** Family Authorised participants Booked vendors

```
STARVNT
```

This is not Facebook. **It is:**

A private network around a real event.

```
35. EVENT CIRCLE ACCESS
```

Before verified booking:

No social event identity.

After verified booking:

Controlled Event Circle access.

Default: 🔒 Private Customer + selected family. 👥 Event Circle Authorised participants + booked vendors. 🌎 Public Only if customer explicitly chooses. **Default must remain:**

Private

```
36. CONTROLLED IDENTITY REVEAL
```

Before booking: Protected Customer ↕

```
STARVNT
```

↕ Business Identity Vendor **After booking: Customer** ↕ Booked Vendor **But still:**

Need-to-know access only.

Reveal: Operational contact Coordinator Exact service location Arrival information Access instructions Schedule Not unnecessary personal data.

```
37. PROGRESSIVE LOCATION REVEAL
```

Before booking:

New Town, Kolkata

During operational planning:

Kisan Palace, New Town

After booking:

Exact service location

Near event:

Arrival point

Service area Access instructions Contact person **This combines:**

Privacy + operational usefulness

`38. MY EVENT COMMAND CENTER`

Once Event exists, the Home experience evolves. **Instead of:**

What are you planning?

Customer sees: My Daughter's Wedding 26 Nov · New Town · 500 Guests 68% Ready Needs your attention 🔴 Catering quote expires tomorrow 🟡 Decoration decision required 🟢 Photography confirmed

---

`39. EVENT PROGRESS`

Planning √ Vendors √ Booking 68% Payment 55% Execution Upcoming Completion — **The customer should instantly answer:**

Where are we?

`40. CONTINUOUS BUDGET`

Budget is not a static number. **Example:** Event Budget ₹3,00,000 Estimated Cost ₹2,78,000 Remaining ₹22,000 **Customer sees:**

You're currently within budget.

If: Estimated = ₹3,12,000 **Aura+:**

"You're currently ₹12,000 above your target. I can explore lower-cost alternatives."

`41. BUDGET OPTIMIZATION`

Aura+ cannot simply say:

"Choose cheaper vendor."

Instead: Budget ↓ Existing Commitments ↓ Requirements ↓ Available Alternatives ↓ Validated Total Cost ↓ Trade-offs ↓ Recommendation ↓ Customer Decision **Example:**

“We can reduce decoration cost by ₹8,000 by changing the package while keeping your confirmed photography unchanged.”

---

42. “WHAT AM I MISSING?”

Permanent CTA:

Ask Aura+

Customer:

“What am I missing?”

Aura+ checks the actual Event Plan. **Example:**

“Your essential arrangements are covered. Transport, guest accommodation and hospitality are still unconfirmed.”

Then:

“Would you like me to arrange transport?”

Customer:

“Yes.”

Requirement workflow starts.

---

43. UPDATES = ATTENTION ENGINE

Updates should not become notification spam. **Only meaningful changes:**

Photography quote expires tomorrow.

Catering menu needs approval.

Payment verified.

Decoration vendor submitted an update.

Photography team checked in.

Therefore:

Updates = What changed + What needs attention

```
44. EVENT TIMELINE
```

10 Nov Event Created 12 Nov Photography Selected 14 Nov Decoration Quote Approved 18 Nov Catering Confirmed 20 Nov Payments Verified 25 Nov Final Coordination 26 Nov

```
EVENT DAY
```

27 Nov Completion This creates an understandable event story.

```
45. CONTEXTUAL MESSAGES
```

Messages should never become a generic WhatsApp clone. **Every conversation is attached to:** Event ↓ Requirement ↓ Vendor ↓ Booking **Examples:** Photographer

“We’ll arrive at 3 PM.”

Caterer

“Final menu confirmed.”

```
STARVNT
```

“Payment verified.”

Aura+

“Your decoration options are ready.”

```
46. NATURAL-LANGUAGE ISSUE RESOLUTION
```

Customer:

“My catering is not working.”

No navigation needed. **System:** Customer Intent ↓ Current Event ↓ Catering Requirement ↓ Current Booking ↓ Vendor ↓ Issue Detection ↓ Alternative Discovery ↓ Cost Validation ↓ Recommendation **Aura+:**

“I found two available alternatives for your date and service location. Would you like me to compare them?”

This is where STARVNT becomes genuinely different from a marketplace.

```
47. EVENT DAY MODE
```

On event day, the UI should become dramatically simpler. Your Event Today 08:00 🟢 Decoration team arrived 09:42 🟢 Photography checked in 10:15 🟡 Catering setup 16:00 ⚪ Guest arrival 18:00 ⚪ Wedding ceremony The customer does not need to operate a complex dashboard.

---

48. “IS EVERYTHING ON TRACK?”

Customer:

> **“Is everything on track?”**

Core currently says: Decoration = COMPLETED Photography = ARRIVED Catering = SETUP_IN_PROGRESS Ceremony = 18:00 **Aura+ answers:**

> **“Yes. Decoration is complete, photography has checked in, and catering setup is currently in progress. Your ceremony is scheduled for 6 PM.”**

If the system does not know something:

> **“I don’t currently have a confirmed check-in for the catering team.”**

This is extremely important.

> **Aura+ must never manufacture operational truth.**

```
49. VENDOR EXECUTION
```

Vendor OS:

```
BOOKING CONFIRMED
```

↓

```
PAYMENT VERIFIED
```

```

```
55. THE GOLDEN CUSTOMER PROTECTION FLOW
```

This is the one flow I would put in bold in every engineering document:

```
CUSTOMER PAYS
```

↓

```
PAYMENT VERIFIED
```

↓

```
BOOKING CONFIRMED
```

↓

```
CUSTOMER PROTECTED
```

↓

```
VENDOR EXECUTES
```

↓

```
COMPLETION CLAIM
```

↓

```
EVIDENCE
```

↓

```
CORE VALIDATION
```

↓

```
┌──────────────┐
│              │
```

↓↓

```
VERIFIED       ISSUE
```

↓↓

```
SETTLEMENT          HOLD
```

ELIGIBLE ↓ ↓ REVIEW SETTLEMENT ↓ ↓ RESOLUTION VENDOR SETTLED ↓

```
REFUND / PARTIAL /
REPLACEMENT / OTHER
```

```
56. PAYMENT FAILURE
```

Customer:

“Reserve this service.”

Payment fails. **Customer sees:**

Payment could not be completed.

CTA:

Try Again

Backend:

```
PAYMENT_INITIATED
```

↓

```
PAYMENT_FAILED
```

↓

```
NO BOOKING CONFIRMATION
```

Retry:

```
PAYMENT_INITIATED
```

↓

```
PAYMENT_CONFIRMED
```

↓

```
BOOKING_CONFIRMED
```

```
57. DUPLICATE PROTECTION
```

Production system must safely handle: Customer Double taps “Create Event”. Payment provider Sends webhook twice. Booking Two simultaneous booking requests. Automation Same event processed twice. Event Circle Creation triggered twice. Notification Same notification action retried. **Expected principle:**

Exactly one valid business outcome.

Not merely:

“No server error.”

```
58. AUDIT
```

Every critical state change:

```
WHO
WHAT
WHEN
FROM STATE
TO STATE
WHY
SOURCE
AUTHORITY
REFERENCE
IDEMPOTENCY KEY
```

Example: Booking: SV-28471 **FROM:**

```
PAYMENT_PENDING
```

TO:

```
PAYMENT_CONFIRMED
```

Source: Payment Webhook + Server Reconciliation **Actor:** System **Authority:** Payment Core **Timestamp:**

```
...
```

Idempotency:

```
...
```

This becomes essential for dispute resolution and debugging.

```
59. SECURITY
```

Customer A:

Access Event B

Result: 403 / Access Denied **Vendor A:**

Access Vendor B booking

Result: Denied **Frontend attempts:**

settlement = approved

Result: Rejected Core remains authoritative.

---

60. SECOND EVENT

After the wedding, customer says:

“Now I want to plan my daughter’s birthday.”

STARVNT does not create a different backend.

CUSTOMER

↓

NEW EVENT

↓

EVENT CONTEXT

↓

REQUIREMENTS

↓

VENDORS

↓

BOOKINGS

↓

EXECUTION

↓

MEMORY

Same architecture.

```
61. MULTI-EVENT HOME
```

Eventually: My Events 💍 Daughter's Wedding 26 Nov · Completed 🎂 Daughter's Birthday 12 Jan · Planning 🏠 Anniversary Coming Soon Each Event has separate state. But the Customer relationship with STARVNT continues.

```
62. EVENT MEMORY
```

After completion:

```
YOUR EVENT STORY
```

📸 428 Photos 🎥 12 Videos 📝 18 Updates ❤️ 126 Reactions ⭐ Vendor Experiences **Tabs:** Highlights | Photos | Videos | Updates **The transaction becomes:**

Memory

```
63. EVENT STORY
```

STARVNT can organise: Your Wedding Story Planning

Your journey began...

The Build-up

Your vendors joined...

The Day

Teams arrived and the celebration began...

The Celebration

Your special moments...

The Memories Photos + Videos + Wishes Customer can edit/share according to permissions.

```
64. COMPLETE SYSTEM MAP
```

Now the entire STARVNT Customer E2E becomes:

```
CUSTOMER
|

65. THREE-LAYER PRODUCT MODEL
```

This could be the prototype's most powerful representation. Layer 1 — CUSTOMER EXPERIENCE Tell ↓ Understand ↓ Plan ↓ Discover ↓ Compare ↓ Decide ↓ Book ↓ Track ↓ Experience ↓ Remember Customer sees simplicity.

Layer 2 — EVENT STATE Idea ↓ Event ↓ Requirements ↓ Options ↓ Decision ↓ Quote ↓ Payment ↓ Booking ↓ Execution ↓ Completion ↓ Memory This is the event's actual lifecycle.

Layer 3 — SYSTEM TRUTH **Aura+** ↓ Core ↓ Requirement ↓ Vendor Ecosystem ↓ Matching ↓ Quote ↓ Payment Core ↓ Booking ↓ Automation ↓ Execution ↓ Evidence ↓ Validation ↓ Protection ↓ Settlement ↓ Event Circle ↓ Memory **The result:**

Customer sees simplicity.

STARVNT handles complexity. Core maintains truth. Policy determines the rules. The outcome determines settlement.

---

66. THE 6 GOLDEN E2E TESTS

E2E-01 — Happy Path Tell → Understand → Event → Requirement → Vendor → Quote → Reserve → Pay → Verify → Book → Execute → Evidence → Validate → Settle → Complete → Memory

---

E2E-02 — Vendor Cancellation Booked → Vendor Cancel → At Risk → Protection → Replacement Discovery → Customer Decision → Rebook / Applicable Resolution

---

E2E-03 — Service Dispute Paid → Booked → Executed → Customer Issue → Settlement Hold → Evidence → Review → Resolution

---

E2E-04 — Payment Failure Payment Initiated → Failed → Retry → Success → Verify → One Booking

---

E2E-05 — Duplicate Events Duplicate Webhook Duplicate Booking Duplicate Automation Duplicate Event Circle **Expected:**

Exactly one valid business outcome.

E2E-06 — Security Customer A → Event B → DENIED Vendor A → Vendor B Booking → DENIED

---

67. FINAL AUTHORITY MATRIX

Concern Authority Customer intent Aura+ + Customer Event truth Core Requirement truth Core Vendor capability Vendor Ecosystem Vendor eligibility Core/Commercial rules Cost calculation Commercial/Core Recommendation Aura+ Customer decision Customer Quote Vendor/Core Payment processing Payment infrastructure Payment verification Payment/Core Booking Core Vendor execution Vendor Completion evidence Vendor Completion validation Core Policy decision Policy Engine Customer protection Core + Policy Settlement eligibility Core + Policy Settlement execution Settlement infrastructure Event Circle access Core/Access policy Event Memory Core/Event system Explanation Aura+

```
68. THE FOUR IMMUTABLE PRINCIPLES
```

🧠 Aura+

Aura+ can understand, explain and recommend — but it cannot manufacture truth.

🏛️ Core

Core owns authoritative business truth.

👤 Customer

The customer owns the decision.

💰 Outcome

Settlement follows validated service outcome, subject to applicable policy.

```
69. THE MOST IMPORTANT PAYMENT RULE
```

Boss, I will write this as STARVNT's internal product principle like this:

Customer Payment is not Vendor Settlement.

And for customer protection:

A vendor's completion claim does not automatically authorize settlement.

And for disputes:

An unresolved service issue keeps the applicable settlement decision under review until the matter is resolved according to the applicable rules.

And for refund/recovery:

When a service failure or other covered event triggers customer protection, the applicable refund, replacement, partial resolution or other remedy follows the defined policy and verified facts.

This makes the system not look like "holding money from the vendor", but rather stand as an outcome-controlled commercial trust system.

```
70. FINAL STARVNT CUSTOMER EXPERIENCE
```

To the customer, the entire large architecture will feel like just:

94 01 — Tell us

“Here’s what I’m planning.”

95 02 — Understand

“Here’s what we understood.”

96 03 — Plan

“Here’s what your event may need.”

97 04 — Discover

“Here are suitable options.”

98 05 — Compare

“Here’s why these options differ.”

99 06 — Decide

“Which would you like?”

100 07 — Reserve

“Secure this service.”

101 08 — Pay

“Your payment is being verified.”

102 09 — Book

“Your booking is confirmed.”

103 10 — Protect

“Your booking is protected under the applicable terms.”

104 11 — Connect

“Your event relationship is now active.”

105 12 — Coordinate

“Here’s what needs your attention.”

106 13 — Experience

“Everything currently confirmed is on track.”

107 14 — Complete

“Your event is complete.”

108 15 — Remember

“Your event story is ready.”

109 16 — Next

“What would you like to celebrate next?”

🏆 FINAL STARVNT PRODUCT PROMISE Finally, the whole product can be distilled into four lines:

The complexity belongs to STARVNT.

The decision belongs to the customer.

The truth belongs to Core.

The outcome determines settlement.

And in front of the customer: **You tell us what you're planning. We'll figure out the rest.** This is what turns your 12-screen UI into a true end-to-end STARVNT Event Operating Experience — where from Welcome to Event Memory not only do the screens change; the same Event, Requirement, Booking, Payment, Execution, Protection, Settlement and Memory states progress continuously. Turn the whole thing into a presentable PDF in English so that a developer can look at it and understand what should be done and what should not be done.
