STARVNT ENTERTAINMENT

UNIVERSAL VENDOR OS + AURA+ MATCHING & CATEGORY INTELLIGENCE

Master Product, Engineering, QA & UAT Specification v2.0

Customer intent → Aura+ understanding → Core requirement → Category-specific matching → Vendor Aura+ → 60-second response → validated options → quote → payment → booking → execution → completion → protection → settlement → event memory

CORE PRINCIPLE

The customer experiences simplicity. STARVNT carries the complexity. Core remains the authoritative source of business truth; Aura+ understands, assists, explains and recommends, but never manufactures eligibility, availability, payment, booking, completion or settlement truth.

Prepared as the consolidated English specification for developer implementation and UAT.

1. Executive Product Direction

STARVNT is not a directory, a generic vendor marketplace, or a chatbot layered over a dashboard. It is an Event Operating System in which one Event can contain many Requirements, many vendor opportunities, many Quotes and many Bookings while remaining connected to one authoritative Core model.

The existing STARVNT product blueprints establish a universal Vendor OS across categories and a customer journey from natural-language intent through planning, discovery, booking, payment, execution, completion, settlement and memory. The vendor-side specification below extends that model with category-specific operational truth so that a caterer is matched as a caterer, a photographer as a photographer, a decorator as a decorator, and so on. ■filecite■turn18file0■L35-L83■

The customer-side blueprint explicitly defines Event → Requirement → Service Location → Vendor Discovery, and states that Event Location is not necessarily the Service Location. This is foundational to category-accurate matching. ■filecite■turn18file4■L1100-L1237■

The target operating principle is: **Vendor sets rules once → STARVNT understands capacity → STARVNT checks feasibility → STARVNT matches opportunities → Vendor Aura+ helps execute the opportunity → Core manages commercial truth → payment is verified → booking is protected → execution is evidenced → completion is validated → settlement is earned.**

This document is an implementation specification, not merely a UI checklist. Every critical state must be proven through UI → API → database → business logic → end-to-end UAT.

2. Architecture & Authority Model

The Core Platform is the official source of truth for business states. The existing engineering blueprint explicitly places Customer, Event, Requirement, Booking, Payment, Execution, Completion and Settlement in Core, and states that other layers must not create parallel versions of these truths. ■filecite■turn18file1■L321-L368■

Layer	Authority / Responsibility	Must NOT do
STARVNT CORE	Official business state, identity, permissions, event, requirements, bookings, payments, execution, completion, settlement	Allow duplicate truth
POLICY ENGINE	Applies category, commercial, cancellation, reservation, disclosure and settlement rules	Become an uncontrolled source of data
MATCHING ENGINE	Eligibility, feasibility, ranking and suitability using validated data	Ignore category capability or availability
NOTIFICATION SERVICE	Delivers authorized opportunity notifications	Invent vendor eligibility
VENDOR AURA+	Interpret opportunity, clarify scope, assist quote, execution guidance	Declare eligibility, payment, booking or settlement
CUSTOMER AURA+	Understand intent, clarify, compare, explain, recommend, surface risks	Create bookings or financial truth
PAYMENT INFRASTRUCTURE	Process payment and provide verifiable transaction signals	Decide business completion
EVIDENCE / VALIDATION	Prove service execution and completion	Rely only on vendor self-claim

Aura+ is explicitly an intelligence layer, not the business authority. The engineering blueprint states that it must not become the source of truth for vendor eligibility, booking, payment, settlement or deterministic commercial calculations. ■filecite■turn18file0■L108-L134■

3. Canonical Aura+ Opportunity Flow

```
CUSTOMER → CUSTOMER AURA+ → INTENT → EVENT → REQUIREMENT → SERVICE LOCATION → CORE → MATCHING ENGINE →
ELIGIBLE VENDOR POOL → NOTIFICATION SERVICE → VENDOR AURA+ → RESPONSE WINDOW → SCOPE VALIDATION → CORE
RANKING → VALIDATED OPTIONS → CUSTOMER AURA+ → DECISION → QUOTE → PAYMENT POLICY → PAYMENT VERIFICATION →
BOOKING → EXECUTION → EVIDENCE → VALIDATION → PROTECTION / RESOLUTION → SETTLEMENT → EVENT MEMORY
```

The customer-side blueprint already defines the flow through Requirement, Service Location, Vendor Discovery, Validation, Total Cost, Compare, Recommend, Decision and Quote, followed by Minimum Reservation, Payment Verification, Booking Confirmation, Customer Protection, Controlled Access, Event Circle, Execution, Evidence, Core Validation, Settlement or Resolution, and Event Memory. ■filecite■turn17file5■L827-L888■

Important: one Event is not one Booking. One Event may contain many Requirements, many Quotes and many Bookings. ■filecite■turn18file4■L1100-L1118■

4. Vendor Opportunity Notification & Response Model

Recommended STARVNT operating rule: when a Requirement becomes actionable, the Core creates a matching job. Eligible vendors in the configured initial search radius receive an opportunity notification through Vendor Aura+. The default initial radius may be 25 km, but the radius must be policy-driven and category-specific rather than hard-coded.

Step	Rule
1. Requirement ready	Date/time, service location, category, service and minimum operational data are sufficiently known
2. Hard eligibility	Category/service, capability, coverage, availability, capacity, travel, verification and policy constraints are checked
3. Initial geography	Default 25 km radius unless category policy overrides it
4. Vendor notification	Only eligible vendors receive the opportunity
5. Response SLA	60-second response window is the recommended operational SLA; it is not the winner-selection rule
6. Response options	CAN_EXECUTE / NEED_CLARIFICATION / NOT_AVAILABLE
7. Ranking	Core ranks validated responders using scope fit, availability, capacity, total cost, travel, reliability, style/service fit and other approved
8. Customer options	Show 1–4 validated options; never fabricate a fourth option merely to fill the UI
9. No sufficient result	Use approved search-wave expansion; do not silently expand geography

The key distinction is that response speed is an SLA, not an automatic winner rule. Fastest vendor must not automatically outrank a better operationally suitable vendor.

5. Geo-Matching & Search Waves

The initial matching radius must be configurable by category, service type and operational feasibility. The customer blueprint requires matching to consider Service Location, Service, Coverage, Availability, Capacity, Eligibility, Travel, Additional Cost, Total Cost, Suitability and Ranking. ■filecite■turn18file6■L1603-L1700■

Policy	Default / Example	Authority
Initial search	25 km default for many local event services	Policy Engine
Category override	Photography, specialist entertainment, venues, etc. may use different radii	Policy Engine
Wave 2	Expand only when insufficient validated candidates exist	Core + Policy
Wave 3	Specialist / long-distance search where category permits	Core + Policy
Travel feasibility	Actual travel time/distance + setup/buffer, not radius alone	Availability / Feasibility Engine
Customer disclosure	Explain when search area is expanded	Customer Aura+

Critical rule: geographic proximity is only one input. A vendor inside 5 km who cannot execute the required service is less eligible than a capable vendor farther away who can operationally deliver it.

6. Validated Vendor Options — Maximum Four

Recommended customer rule: display up to four validated options. If only one, two or three vendors genuinely pass the threshold, show only those. Quality must never be sacrificed to satisfy a UI quota.

Qualified vendors	Customer result
0	No option; Aura+ explains why and offers an approved next step
1	Show 1 validated option

Qualified vendors	Customer result
2	Show 2 validated options
3	Show 3 validated options
4+	Show top 4 validated options

Customer-facing cards should emphasize validated total cost, relevant inclusions, operational fit, availability and why the option is suitable. The blueprint's recommendation model explicitly uses validated total cost rather than advertised price alone. ■filecite■turn18file8■L2087-L2133■

7. Universal Vendor Data Model

Every vendor must have a universal base model plus category-specific capability modules. Do not force all categories into the same fields.

Universal field group	Required data
Identity	Vendor ID, legal/business name, display name, verification status, ownership
Category	Primary category, secondary categories, service taxonomy IDs
Services	Exact services offered, package/service IDs, active/inactive status
Capability	Category-specific execution capabilities
Capacity	Team, equipment, quantity, concurrent job limits
Location	Base city/area, service area, coverage radius, geo coordinates
Availability	Working hours, blocked slots, confirmed bookings, temporary holds
Commercial	Pricing model, packages, minimums, travel policy, taxes/fees, cancellation terms
Portfolio	Structured project records, media, event type, location, date, service tags
Operations	Lead response, quote response, check-in, milestones, completion evidence
Reputation	Verified STARVNT reviews, completion rate, issue rate, response metrics
Security	Tenant ownership, authorization, audit trail

8. Universal Category Taxonomy

This category layer is intentionally broad. STARVNT should support a common event-service taxonomy while allowing each category to define its own operational truth. The existing customer blueprint already names Venue, Catering, Photography, Decoration, Makeup, Sound, Ceremony/Purohit, Transport, Accommodation, Hospitality, Invitation, Anchor, Entertainment, Backup Planning, Photo Booth, Special Effects, Live Streaming and Premium Entertainment as event-plan categories. ■filecite■turn19file4■L974-L1013■

Category	Examples / sub-services
Venue	Banquet hall, lawn, resort, hotel, rooftop, convention hall, farmhouse
Catering	Buffet, plated, live counters, snacks, beverages, dessert, specialty cuisine, staffing
Decoration	Stage, mandap, floral, entrance, ceiling, lighting décor, tablescape, draping, thematic décor
Photography	Candid, traditional, cinematic, pre-wedding, drone where legal/approved, albums, reels
Videography	Wedding film, cinematic film, highlights, live feed, multi-camera production
Makeup & Beauty	Bridal makeup, groom makeup, family makeup, hairstyling, draping, touch-up team
Mehendi	Bridal mehendi, guest mehendi, artists, duration, design complexity

Category	Examples / sub-services
DJ / Sound	DJ, sound system, speakers, consoles, microphones, mixers, monitors, operators
Lighting	Stage lighting, architectural lighting, moving heads, ambient lighting, power requirements
Anchor / Host	Bilingual anchor, wedding host, corporate host, game host, protocol/ceremony host
Singer / Live Music	Solo singer, duo, acoustic, band, classical, regional, playback-style performer
Entertainment	Dance troupe, magician, comedian, mimicry, live act, cultural performers
Choreography	Couple choreography, family performance, sangeet choreography, rehearsal management
Ceremony / Purohit	Priest, ceremony specialist, rituals, timing, materials/requirements
Transport	Airport transfer, guest shuttle, luxury car, bus, tempo traveller, driver, route plan
Accommodation	Rooms, guest blocks, check-in/out, room inventory, breakfast, transport linkage
Hospitality	Welcome desk, guest management, ushers, registration, concierge, hospitality crew
Invitation	Printed cards, digital invites, RSVP management, courier/distribution
Photo Booth	Standard booth, 360 booth, instant print, backdrop, props, operator
Special Effects	Confetti, approved effects, CO2/fog, cold-spark type effects subject to venue/legal approval
Live Streaming	Single-camera, multi-camera, platform streaming, internet/bandwidth requirements
AV / LED	LED wall, projection, stage screens, playback, technical operators
Furniture / Rentals	Chairs, tables, sofas, bars, linens, décor props, staging
Power / Generator	Generator, backup power, distribution, load planning, operators
Security / Safety	Security guards, crowd control, access control, safety coordination
Valet / Parking	Valet team, parking management, signage, vehicle flow
Artist / Specialist	Celebrity/local artist, cultural act, instrumentalist, specialist performer
Venue Management / Coordination	Event-day coordination, vendor coordination, production management

9. Category-Specific Requirement Schemas

This is the most important Vendor OS expansion. Each category must have category-specific fields so the matching engine understands what the vendor actually does. A generic 'service = yes' flag is not sufficient.

Category	Category-specific requirement data	Core matching signals
Catering	Cuisine; meal count; guest count; service style; menu; veg/non-veg; live counters; beverages; staffing; kitchen access; service time	Guest count, cuisine, service style, menu fit, kitchen/logistics, staffing, ho
Decoration	Event area; stage size; mandap; floral type; draping; ceiling; entrance; lighting; theme; material preferences	Area/size, theme, materials, capacity, storage, setup time, crew
Photography	Coverage hours; photographers required; candid/traditional; video; cinematic; drone; album; deliverables; style	Coverage hours, crew size, style, equipment, deliverables, style
DJ / Sound	Guest count; venue size; DJ hours; sound package; speaker count; microphones; mixer; monitors; power; genre	Load, equipment inventory, crew, power, genre restrictions, event hours
Anchor	Language; event type; stage time; audience size; script support; rehearsal; host style; language/genre	Language, time, audience size, event type, availability, host capability
Singer / Live Music	Solo/duo/band; genre; language; set duration; number of sets; instruments; sound rider; travel	Artist capability, repertoire/genre, set duration, technical rider, availability, tr
Makeup	Bridal/groom/family count; makeup type; hairstyle; draping; touch-ups; location; start times; artists required	People count, time windows, artist capacity, skill type, travel
Mehendi	Bridal/guest count; design style; artist count; hours; seating; cone/material requirements	Artist capacity, people count, estimated service duration, design capability
Transport	Vehicle type; passenger count; luggage; pickup/drop; route; number of trips; timing; driver; backup vehicle	Vehicle capacity, route feasibility, driver/vehicle availability, turnaround time
Venue	Capacity; indoor/outdoor; date; time; rooms; parking; power; catering policy; décor restrictions; sound rules	Capacity, date availability, venue rules, service compatibility, logistics

Category	Category-specific requirement data	Core matching signals
AV / LED	Screen size; resolution; stage dimensions; playback; content operator; camera feed; power; backup	Equipment inventory, technical load, operator capacity, setup window
Live Streaming	Platform; cameras; resolution; duration; internet; encoder; operator; backup connectivity	Equipment, bandwidth, crew, platform capability, redundancy
Entertainment	Act type; duration; audience; stage area; rider; language; technical needs; number of performers	Act availability, team size, stage/technical fit, availability
Choreography	Couple/family/team count; songs; rehearsal dates; number of sessions; venue rehearsal access	Trainer capacity, rehearsal schedule, participant count, session availability
Ceremony / Purohit	Ceremony type; tradition; duration; language; materials; auspicious timing; travel	Ceremony capability, timing, language/tradition fit, availability
Hospitality	Guest count; shifts; desk; ushers; rooming; VIP handling; languages; dress code	Crew capacity, shifts, language, guest count, venue logistics
Accommodation	Room count; room type; nights; check-in/out; breakfast; transport; guest mix	Inventory, date availability, room capacity, policy
Invitation	Print quantity; design; language; RSVP; delivery locations; digital format	Production capacity, lead time, delivery area, format capability
Photo Booth	Booth type; hours; prints; props; backdrop; operator; power; footprint	Equipment availability, operator, venue footprint, power
Special Effects	Effect type; duration; venue permission; safety constraints; operator; power	Equipment, venue approval, safety constraints, trained operator
Generator / Power	Load in kVA; hours; fuel; distribution; backup; operator	Load capacity, availability, fuel/logistics, operator
Security / Valet	Guest count; entry points; shifts; vehicle volume; VIP handling	Crew capacity, shift coverage, site logistics

10. Category-Specific Matching Rules

Hard constraints must run before ranking. The Core must never treat all vendor categories as if they share the same feasibility logic.

Category	Hard constraints before ranking	Typical capacity unit
Catering	Cuisine/service style + guest capacity + date/time + kitchen/logistics + staffing	Guests / meals per service
Decoration	Scope/area + setup window + materials + crew + venue restrictions + date	Concurrent events / crew / area
Photography	Coverage hours + required team + equipment + date/time + deliverables	Teams / cameras / hours
DJ/Sound	Equipment load + power + venue restrictions + crew + date/time	Equipment kits / crew
Anchor	Language + host type + date/time + event duration	Hosts / hours
Singer/Band	Artist availability + genre/style + set duration + technical rider	Artists / sets
Makeup	People count + service duration + artists + start time + travel	Clients per team / artists
Transport	Vehicle type + passenger/luggage capacity + route + timing + driver	Vehicles / seats
Venue	Capacity + date/time + event type + restrictions + rooms/parking if needed	Guests / slots
Live Streaming	Internet + camera package + operator + platform + duration	Streams / rigs / crew
Entertainment	Act type + stage/technical requirements + performers + duration	Acts / performers
Ceremony/Purohit	Ceremony type + timing + tradition/language + materials	Ceremonies / priests

If a category cannot be reduced to a single numeric capacity, model capacity as a capability/resource constraint rather than forcing a fake number.

11. Availability & Capacity Must Be Category-Aware

Working Day ≠ Available Capacity. Availability must combine working hours, blocked slots, confirmed bookings, temporary holds, team capacity, equipment capacity, travel time and setup/breakdown buffers.

Examples: a caterer may be able to serve two events only if the meal windows, kitchen logistics and staffing permit it; a photographer may have one team available for one overlapping booking; a DJ may have multiple equipment kits but only one operator; a decorator may have several crews; a singer may be a single-person bottleneck.

Required result states: AVAILABLE, BLOCKED, CONFLICT, INSUFFICIENT_TEAM, INSUFFICIENT_EQUIPMENT, TRAVEL_CONFLICT, TEMPORARILY_HELD, POLICY_BLOCKED.

12. Vendor Aura+ — Opportunity Copilot

Vendor Aura+ is not the matcher. It is the execution copilot attached to a Core-approved opportunity.

Vendor Aura+ function	Required behaviour
Opportunity brief	Explain event type, service, date/time, service location level, guest count and scope
Category interpretation	Translate category-specific requirements into vendor-operational language
Reference analysis	Help interpret customer references, style, scope and constraints
Capability check	Ask targeted questions when execution feasibility is unclear
Quote assistance	Draft a quote from vendor-confirmed scope; never invent price or inclusion
Missing-data detection	Identify missing operational information before quote submission
Execution brief	Turn approved scope into milestones, checklist and evidence requirements
Risk alerts	Flag conflicts, missing capacity, timing or resource issues
Status explanation	Explain Core state without creating state

Vendor Aura+ may say: 'This opportunity appears to require two photographers for eight hours.' It must not say: 'You are eligible' unless Core has already returned that fact.

13. Customer Aura+ — Planning & Decision Copilot

Customer Aura+ should understand natural language and voice, detect missing requirements, plan, compare vendors, explain recommendations, surface budget/risk issues and guide the next action. The blueprint explicitly defines these as Aura+ responsibilities. ■filecite■turn18file1■L443-L466■

- Understand: extract event, service and preference context.
- Clarify: ask one useful question only when the answer changes feasibility, price, experience or execution.
- Structure: create/update Requirement objects in Core.
- Compare: explain validated options using Core facts.
- Recommend: explain the reason behind a Core-approved recommendation.
- Protect: surface risk, issue, cancellation or completion states.
- Recover: help discover replacement options when a vendor fails or cancels.
- Never invent: availability, price, rating, payment success, booking, completion or settlement.

14. Progressive Access & Privacy

Protected discovery must hide unnecessary customer and vendor private data before booking. After verified booking, need-to-know operational details can be unlocked. The customer blueprint explicitly describes this progressive disclosure model. ■filecite■turn19file5■L1310-L1417■

Stage	Vendor-visible information
Before match	Opportunity category, general service area, date/time context, requirement summary
Matched / responding	Additional scope needed to evaluate execution; no unnecessary personal data
Quote stage	Approved commercial context and scope required to quote
Booking confirmed	Exact service location and relevant operational contacts/instructions as authorized

Stage	Vendor-visible information
Near event	Arrival point, access instructions, contact person and final operational details

15. Commercial, Quote & Payment Integration

Do not hard-code a universal 30% advance. The customer blueprint defines the minimum reservation amount as a result of Booking Value + Vendor Policy + Service Type + Payment Policy + Business/Risk Rules. ■filecite■turn18file8■L2180-L2201■

Recommended policy model: RESERVATION_PERCENTAGE, FIXED_AMOUNT, MILESTONE_PLAN or SERVICE_SPECIFIC_POLICY. A 30% policy may exist, but it must be a policy value rather than a global invariant.

Payment state must be separated from vendor settlement. The blueprint explicitly distinguishes payment verification, funds custody, settlement eligibility and settlement execution. ■filecite■turn19file8■L2136-L2168■

Payment flow: PAYMENT_INITIATED → PAYMENT_INTENT → GATEWAY → PROCESSING → SERVER VERIFICATION → WEBHOOK → RECONCILIATION → PAYMENT_CONFIRMED → BOOKING_VALIDATION → BOOKING_CONFIRMED. ■filecite■turn19file5■L1216-L1301■

If StarVnt commercial margin is 10% for a particular business model, store it as a Policy Engine rule with effective dates, category/service scope, tax treatment and audit history. Never hard-code '10%' inside frontend or Aura+ logic.

16. Execution, Evidence, Completion & Settlement

Vendor execution lifecycle: BOOKING_CONFIRMED → PAYMENT_VERIFIED → SERVICE_SCHEDULED → CHECK_IN → SERVICE_STARTED → MILESTONE → SERVICE_COMPLETED → EVIDENCE_SUBMITTED → CORE_VALIDATION. The blueprint explicitly states that the vendor operates while Core remains authoritative. ■filecite■turn19file6■L1566-L1611■

Completion is service-specific. A photographer may have event-day service plus later album delivery; a caterer may complete on event day; a decorator may require setup + event execution + dismantling. The blueprint explicitly states that settlement policy is service-specific. ■filecite■turn19file8■L1995-L2012■

Outcome	Meaning
PASS	Service and evidence satisfy category-specific completion rules
REVIEW	Completion is unclear; settlement remains on hold
PARTIAL	Some contracted service delivered; partial commercial resolution may apply
FAIL	Service materially incomplete; protection/resolution workflow starts

17. Category-Specific Completion & Evidence Rules

Category	Completion evidence examples	Settlement trigger examples
Catering	Service photos, meal/service confirmation, staffing, menu execution, issue record	Service delivered + agreed meal/service scope verified
Decoration	Setup photos, dismantling confirmation, milestone checklist, venue confirmation	Setup + event execution + dismantling if contracted
Photography	Check-in, coverage completion, shot/coverage log, later deliverable tracking	Event coverage verified; album/deliverables may have separate milestone
DJ/Sound	Check-in, equipment setup, soundcheck, event completion	Technical service completed
Anchor	Check-in, run-of-show completion, customer/event evidence	Agreed hosting duration/service completed
Singer/Band	Check-in, set completion, event evidence	Agreed performance delivered
Makeup	Check-in, service completion, agreed client count	Agreed services completed
Transport	Trip logs, pickup/drop confirmation, vehicle/driver evidence	Trips completed
Venue	Handover/usage confirmation, event slot completion, issue record	Venue service delivered under contract
Live Streaming	Stream logs, uptime, recording/delivery evidence	Agreed stream completed and deliverables met

Category	Completion evidence examples	Settlement trigger examples
Entertainment	Check-in, act performance evidence, stage completion	Agreed act delivered

18. Customer Protection & Vendor Replacement

Customer protection is a first-class operational system, not a generic support ticket. The customer blueprint defines vendor cancellation recovery as VENDOR_CANCELLED → BOOKING_AT_RISK → CUSTOMER_PROTECTION → ALTERNATIVE_DISCOVERY → VALIDATION → customer decision → quote → approval → payment/commercial adjustment → booking. ■filecite■turn19file7■L1791-L1855■

- Vendor cancellation
- Customer issue
- Service incomplete
- Partial delivery
- Payment failure
- Availability conflict
- Operational delay
- Replacement vendor discovery
- Refund / partial refund / commercial adjustment
- Resolution and audit trail

Aura+ may detect, explain and recommend. Core/Policy decides. Payment infrastructure executes approved financial actions.

19. Security, Ownership, Audit & Idempotency

Every protected Vendor OS resource must enforce backend ownership. Frontend filtering is never a security boundary.

Requirement	Acceptance rule
Vendor ownership	Authenticated vendor may access only owned enquiries, quotes, bookings, media, reviews, conversations, resources and payment r
ID tampering	Cross-vendor resource ID manipulation returns 403 / equivalent authorization failure
Audit	WHO, WHAT, WHEN, FROM_STATE, TO_STATE, WHY, SOURCE, AUTHORITY, REFERENCE_ID, IDEMPOTENCY_KEY
Idempotency	Duplicate request/webhook produces one valid business outcome
Payment callbacks	Duplicate gateway callbacks are safely ignored
Booking creation	Duplicate booking prevented even under refresh, double click or callback retry
Notification	Duplicate notifications prevented or safely deduplicated
Tenant isolation	No customer/vendor can access another tenant's protected data

The customer blueprint explicitly requires duplicate gateway callbacks to be safely ignored and duplicate booking actions to be prevented through idempotency. ■filecite■turn19file7■L1861-L1898■

20. Vendor Notifications & Attention Engine

Notifications must be event- and opportunity-driven, not a broadcast spam system. The customer blueprint defines meaningful updates as changes that require attention, such as quote expiry, payment verification, menu approval, vendor updates and team check-in. ■filecite■turn19file1■L349-L369■

Vendor opportunity notification should contain only what is necessary to decide whether to respond. Notification payload should be generated from the Core-approved opportunity snapshot and category schema.

Notification type	Trigger
NEW_OPPORTUNITY	Vendor becomes eligible and matching job opens
RESPONSE_EXPIRING	Response SLA approaching deadline
OPPORTUNITY_CLOSED	SLA ended or sufficient candidate pool achieved under policy
QUOTE_ACTION_REQUIRED	Customer action required
BOOKING_CONFIRMED	Core booking state confirmed
EXECUTION_REMINDER	Upcoming service milestone
CHECK_IN_REQUIRED	Operational check-in due
COMPLETION_ACTION_REQUIRED	Evidence or completion submission due
SETTLEMENT_STATUS	Settlement state changes
PROTECTION_ALERT	Booking or service risk detected

21. Contextual Messaging & Event Circle

Messages must not become a generic WhatsApp clone. The blueprint defines the context tree as Event → Requirement → Vendor → Quote/Booking → Message. ■filecite■turn19file6■L1488-L1507■

After the first verified booking, an Event Circle can connect the customer, authorized family/participants and booked vendors within the same Event context. Access remains controlled and privacy-first. ■filecite■turn19file5■L1327-L1383■

22. Eligibility ≠ Ranking ≠ Recommendation

This separation is essential for scale.

Stage	Question
Eligibility	Can this vendor actually execute this requirement under current rules?
Suitability	How well does the vendor fit the requirement operationally and commercially?
Ranking	Which validated candidates should be shown first?
Recommendation	How should Aura+ explain the best options to the customer?

The existing Vendor OS blueprint describes discovery as Requirement → Service Location → Coverage → Availability → Capacity → Eligibility → Cost → Suitability → Vendor Options. ■filecite■turn18file0■L79-L83■

23. Vendor Intelligence & Reputation

Vendor rating must never be the only trust signal. Build a Vendor Trust Profile from verified operational outcomes.

- KYC / verification status
- Availability accuracy
- Response rate and response SLA performance
- Quote accuracy
- Booking completion rate
- On-time / check-in performance
- Service completion quality
- Verified customer reviews
- Issue / dispute rate

- Resolution performance
- Cancellation rate
- Category-specific delivery metrics

Aura+ may explain these signals, but the underlying values must come from Core records.

24. Mandatory End-to-End UAT

Run at least one complete transaction per major category family. A single photography test is not sufficient to prove a universal Vendor OS.

Minimum golden path: CUSTOMER → AURA+ → EVENT → REQUIREMENT → SERVICE LOCATION → MATCHING → VENDOR AURA+ → RESPONSE → QUOTE → CUSTOMER DECISION → PAYMENT → SERVER VERIFICATION → BOOKING → CALENDAR RESERVATION → TEAM/EQUIPMENT RESERVATION → EXECUTION → EVIDENCE → CORE VALIDATION → COMPLETION → REVIEW → SETTLEMENT.

Test family	Required categories
Food/service volume	Catering
Physical production	Decoration / Stage / Lighting
Team + deliverables	Photography / Videography
Technical equipment	DJ / Sound / AV / LED
Individual performer	Anchor / Singer
Multi-person beauty	Makeup / Mehendi
Transport logistics	Transport
Venue inventory	Venue
Digital technical	Live Streaming
Performance act	Entertainment / Choreography
Ceremonial service	Purohit / Ceremony

25. Category-Specific UAT Matrix

Category	Critical UAT
Catering	Guest count capacity; cuisine match; meal timing; staffing; kitchen constraints; overlapping event capacity; quote includes all mandatory scope
Decoration	Stage/area fit; material capability; setup/dismantling windows; crew capacity; venue restrictions; portfolio scope fit
Photography	Coverage hours; team count; equipment; style; deliverables; overlapping booking prevention; later deliverable milestone
DJ/Sound	Equipment load; venue sound rules; power; crew; setup/soundcheck; timing
Anchor	Language; event type; audience size; availability; run-of-show; duration
Singer/Band	Artist availability; genre; set duration; technical rider; backup policy
Makeup	People count; artist capacity; start time; service duration; location/travel
Transport	Vehicle capacity; route; passenger/luggage; turnaround; driver; backup
Venue	Guest capacity; date; venue restrictions; parking; power; catering policy; sound rules
Live Streaming	Bandwidth; camera count; platform; operator; redundancy; recording delivery
Entertainment	Act suitability; stage size; technical rider; performer count; duration
Purohit	Ceremony type; timing; tradition/language; materials; travel

26. Failure & Recovery Matrix

Failure	Expected behaviour
No eligible vendors	No fake options; explain blocker; approved search expansion or requirement clarification
No vendor responds	Close wave, update customer, optionally expand under policy
Vendor says YES but lacks capacity	Core validation rejects; vendor cannot quote as executable
Duplicate webhook	Ignored safely; one payment record
Payment failure	Payment not confirmed; hold/slot policy applied; retry available
Duplicate booking	One booking only
Vendor cancellation	Booking at risk → protection → replacement flow
Partial service	Completion PARTIAL → resolution / partial settlement policy
Cross-vendor ID tampering	403 / authorization failure
Blocked date conflict	Backend rejects booking/block action as applicable
Travel conflict	Availability conflict; vendor excluded
Insufficient team/equipment	Vendor excluded or capacity conflict
Quote expired	Cannot accept/pay; renew or new revision
Aura+ uncertainty	Aura+ states that confirmed data is unavailable rather than guessing

27. Developer Delivery Proof

No module is complete because a screen looks correct. For every P0 business state, the developer must provide five proofs:

Proof	Example for payment
1. UI proof	Customer sees payment state correctly
2. API proof	Payment intent / verification endpoints return canonical state
3. Database proof	Payment, booking and traceability records are persisted correctly
4. Business logic proof	Webhook verification, idempotency and booking rules execute correctly
5. E2E proof	Gateway → webhook → reconciliation → Core → booking → vendor display

The golden rule is UI → API → Database → Business Logic → E2E UAT. A screenshot is never sufficient proof of a business state.

28. Recommended Implementation Order

Phase	Priority	Work
0. Architecture Freeze	P0	Lock Event, Requirement, Vendor, Matching, Availability, Quote, Payment, Booking, Policy, Protection, Completion,
1. Core Trust Layer	P0	Canonical states, ownership, KYC, matching eligibility, event/requirement model, audit
2. Category Intelligence	P0	Taxonomy, category schemas, capability, capacity, service-specific matching rules
3. Commercial Core	P0	Quote state, versioning, policy-driven reservation, payment verification, idempotency, booking
4. Availability Engine	P0	Working hours, blocks, holds, team/equipment capacity, travel and automatic reservations
5. Aura+ Opportunity Loop	P0	Customer intent, requirement builder, vendor opportunity brief, response SLA, customer options
6. Protection & Completion	P0	Evidence, validation, cancellation/replacement, partial service, settlement eligibility

Phase	Priority	Work
7. Operations UX	P1	Messaging, Event Circle, timeline, attention engine, analytics
8. Experience Layer	P2	Mobile polish, accessibility, advanced Aura+ UX, event memory
9. Scale Engine	P1/P2	Vendor trust intelligence, category expansion, ranking optimization, multi-city liquidity

29. Scale Strategy — How STARVNT Becomes Hard to Copy

The moat is not 50 more screens. The moat is the operational graph around an Event: Customer → Event → Requirement → Vendor → Quote → Payment → Booking → Capacity → Execution → Evidence → Validation → Protection → Settlement → Memory.

- Start with category depth before geographic breadth. Make 2–3 categories extremely reliable in Kolkata before expanding widely.
- Build category-specific supply intelligence. A caterer, decorator and photographer should have different operational models.
- Use the 25 km initial search rule as a policy, not a hard-coded platform constant.
- Use up to four validated options, not four arbitrary options.
- Capture execution outcomes, not only star ratings. This improves future matching.
- Turn vendor cancellations and service failures into recovery workflows rather than support dead ends.
- Make Event Memory the retention layer so a wedding can lead to birthdays, anniversaries, family events and corporate events.
- Keep Aura+ on top of validated Core truth. AI should reduce customer complexity while internal system complexity remains high.

This direction is consistent with the existing blueprint's principle: customer complexity should remain low while STARVNT's internal complexity is high; Core truth is authoritative and Aura+ is helpful. ■filecite■turn17file3■L480-L486■

30. Final Acceptance Criteria

Vendor OS / Aura+ Matching PASS only if all applicable checks are true:

- Universal Vendor OS supports category-specific capability, capacity, pricing and execution rules.
- Event Location and Service Location are modeled separately.
- One Event can contain many Requirements and many Bookings.
- Eligibility is deterministic and backend-authoritative.
- Category-specific hard constraints are evaluated before ranking.
- Default 25 km initial radius is policy-driven and can be overridden by category/service rules.
- 60-second vendor response is treated as a response SLA, not an automatic winner rule.
- Only Core-approved eligible vendors receive opportunity notifications.
- Customer sees up to four genuinely validated options.
- Aura+ never invents availability, price, payment, booking, completion or settlement.
- Quote versioning and expiry are enforced.
- Reservation amount is policy-driven, not globally hard-coded to 30%.
- Payment is server-verified and idempotent.
- Payment confirmation is distinct from vendor settlement.
- Booking automatically reserves applicable calendar/team/equipment capacity.
- Vendor execution is category-aware.

- Completion validation is category-specific.
- Protection and replacement workflows exist for cancellation and service failure.
- Audit trail exists for every critical state change.
- Cross-vendor data access is blocked at backend authorization.
- Messaging remains attached to Event → Requirement → Vendor → Quote/Booking context.
- Mobile and desktop surfaces reflect Core truth consistently.
- Every P0 state is proven through UI + API + DB + business logic + E2E UAT.

FINAL RULE

Do not mark any module 'complete' because the UI looks complete. STARVNT is complete only when the business truth is correct, category-specific, secure, idempotent, auditable and proven end-to-end.

Source alignment: consolidated from the existing STARVNT Customer E2E Product Blueprint and STARVNT Complete Product & Engineering Structure, with the category-specific Vendor OS requirements and implementation rules added in this specification. ■filecite■turn17file0■L24-L37■
